# From the Easter island .....

*In 1964 a Canadian researchers expedition from the Ayerst-Wyeth Pharmaceuticals traveled to Easter island to gather soil samples and plants.*

*In 1972 the expedition team and a microbiology team identified and isolated RAPAMYCIN from the mycobacterium Streptomyces Hygroscopicus*

# Rapamycin properties

*Several years later Rapamycin demonstrated antifungal activity blocking the G1 to S phase of the cell cycle.*

*The block of G1 to S phase of the cell cycle in T-lymphocytes revealed a potent immunosuppressant activity of Rapamycin in mammals.*

# The birth of the Rapalogs

*Rapamycin demonstrated antiproliferative activity in vitro and in vivo in human tumor xenografts implanted into immunosuppressed mice*

*Rapamycin and its analogs (globally called RAPALOGS) were developed in organ transplantation and oncology, starting from the Biozentrum (Basel) and Sandoz Pharmaceuticals (now Novartis) laboratories.*

# The molecular target of rapamycin

*Two classes of resistant yeast had mutations in genes named TOR1 and TOR2 in honor of the Spalentor, a gate of the city of Basel, where TOR was first discovered.*

SpalenTOR, Basel, S

## mTOR regulation of autophagy

Chang Hwa Jung, Seung-Hyun Ro, Jing Cao, Neil Michael Otto, and Do-Hyung Kim

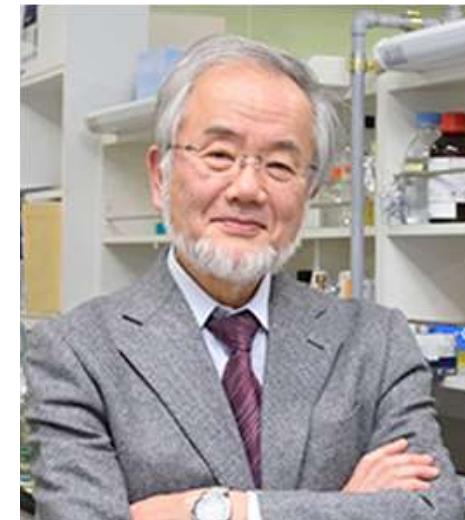

*Autophagy is a self-degradative process that is important for balancing sources of energy at critical times in development and in responding to nutrient stress.*

# 2016 NOBEL PRIZE FOR PHYSIOLOGY OR MEDICINE TO YOSHINORI OHSUMI FOR AUTOPHAGY

**Nobelförsamlingen**

The Nobel Assembly at Karolinska Institutet

The Nobel Assembly at Karolinska Institutet has today decided to award

the 2016 Nobel Prize in Physiology or Medicine

to

**Yoshinori Ohsumi**

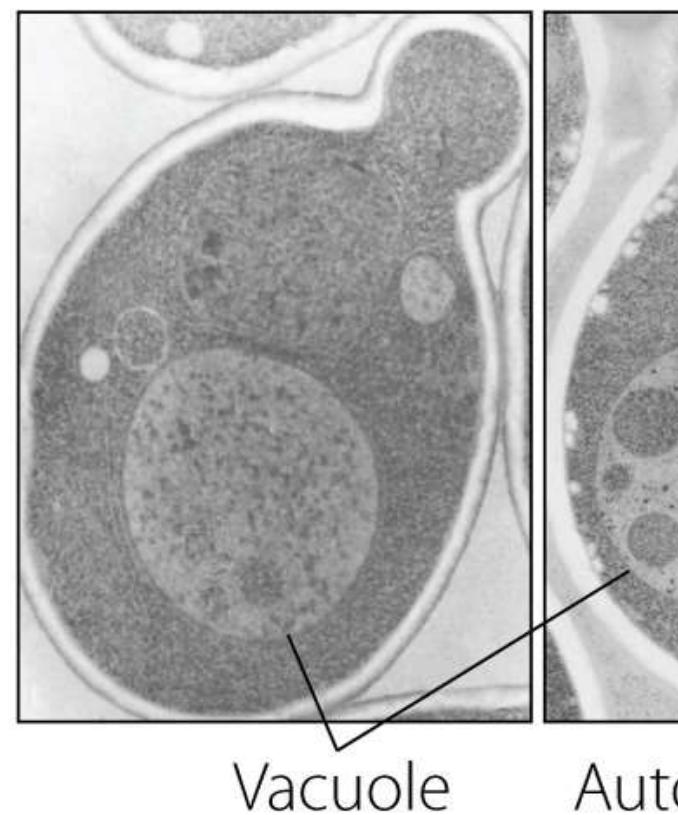

# Autophagy = self eating

*The cell can destroy its own components forming the lysosomes*

*Ohsumi identified genes involved in autophagy. Alterations in these genes can occur in cancer.*

*The Belgian Christian de Duve was awarded the Nobel Prize for Physiology or Medicine in 1974 for the discovery of the lysosome*

Control

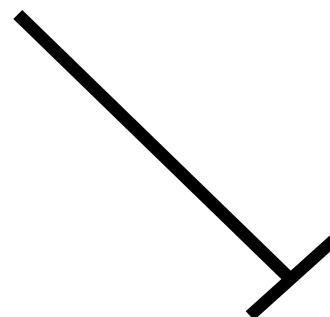

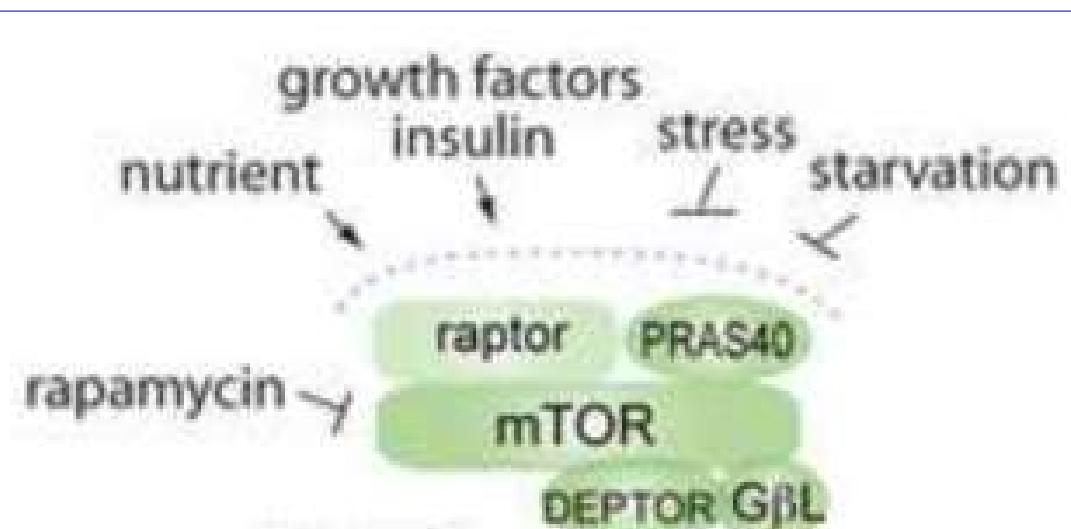

Vacuole

*“Proteasomes” represent another cellular*

**mTORC1 physiologically suppresses autophagy.**

## RADIANT (RAD001 in Advanced Neuroendocrine Tumors)

Trial	N. pts	Popul.	Therapy	Approval			
<b>RADIANT-2</b>	<b>429</b>	carcinoid syndrome NET	EVE + OCT PLB + OCT	Not approved for carcinoid syndrome-related NET			
Arm A	216						
Arm B	213						
<b>RADIANT-3</b>	<b>410</b>	Pancreatic well /moderately differentiated NET	EVE PLB	Approved for well/moderately differentiated, advanced, pancreatic NET			
Arm A	207						
Arm B	203						

# RADIANT-3 trial

## (410 pancreatic NET patients randomized 1:1)

### B Progression-free Survival, Adjudicated Central Review

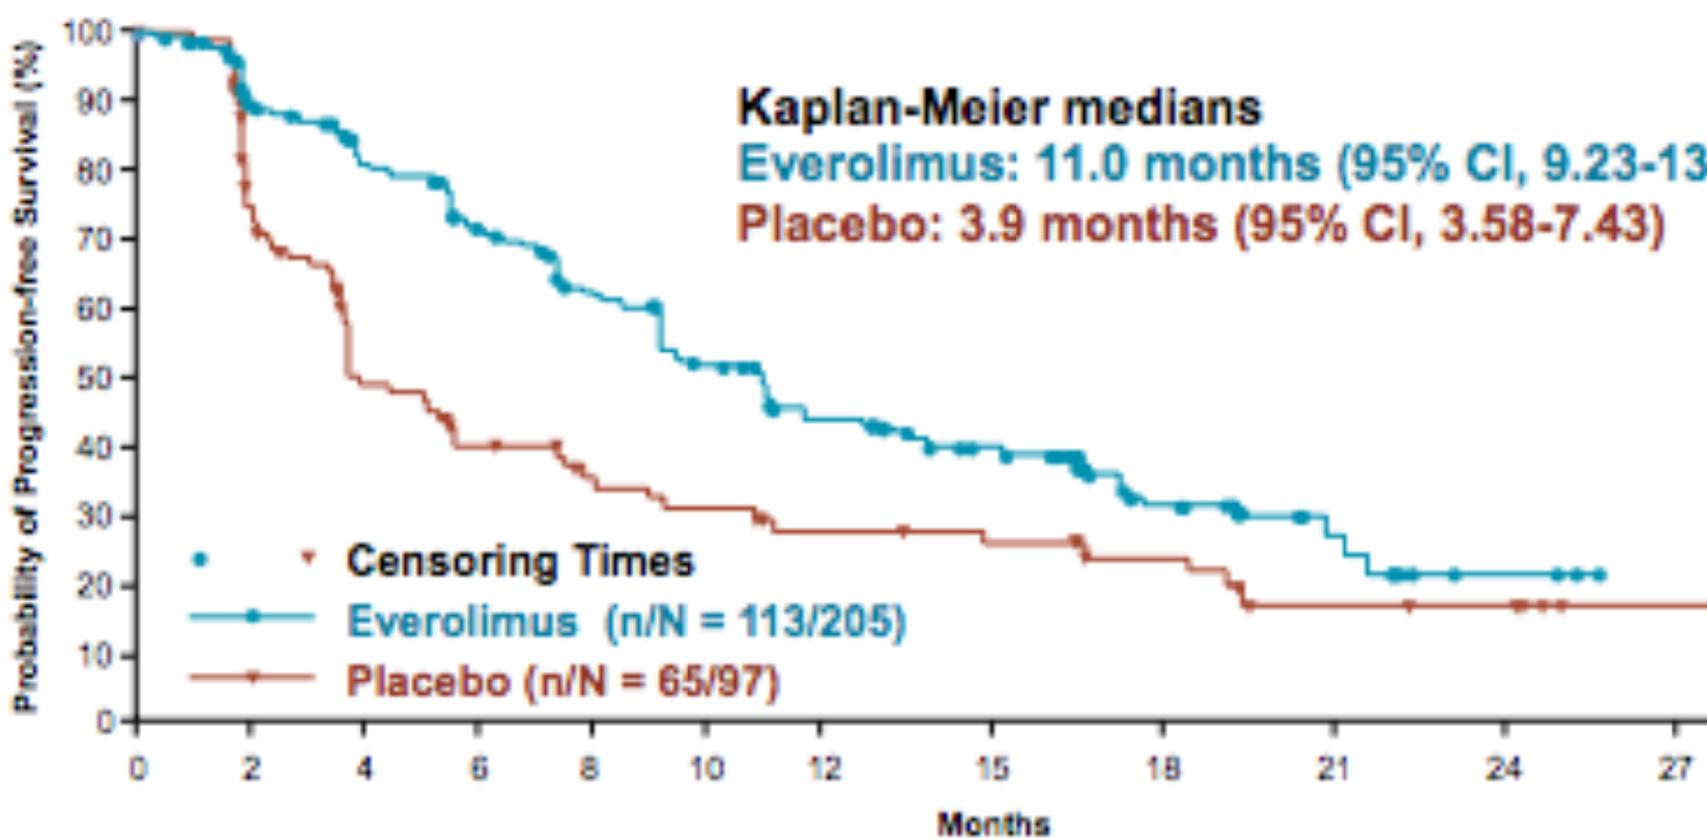

# RADIANT-4 trial (302 patients with GI and lung NET randomized)

## Primary Endpoint: PFS by Central Review

52% reduction in the relative risk of progression or death with everolimus vs placebo

HR = 0.48 (95% CI, 0.35-0.67);  $P < 0.00001$

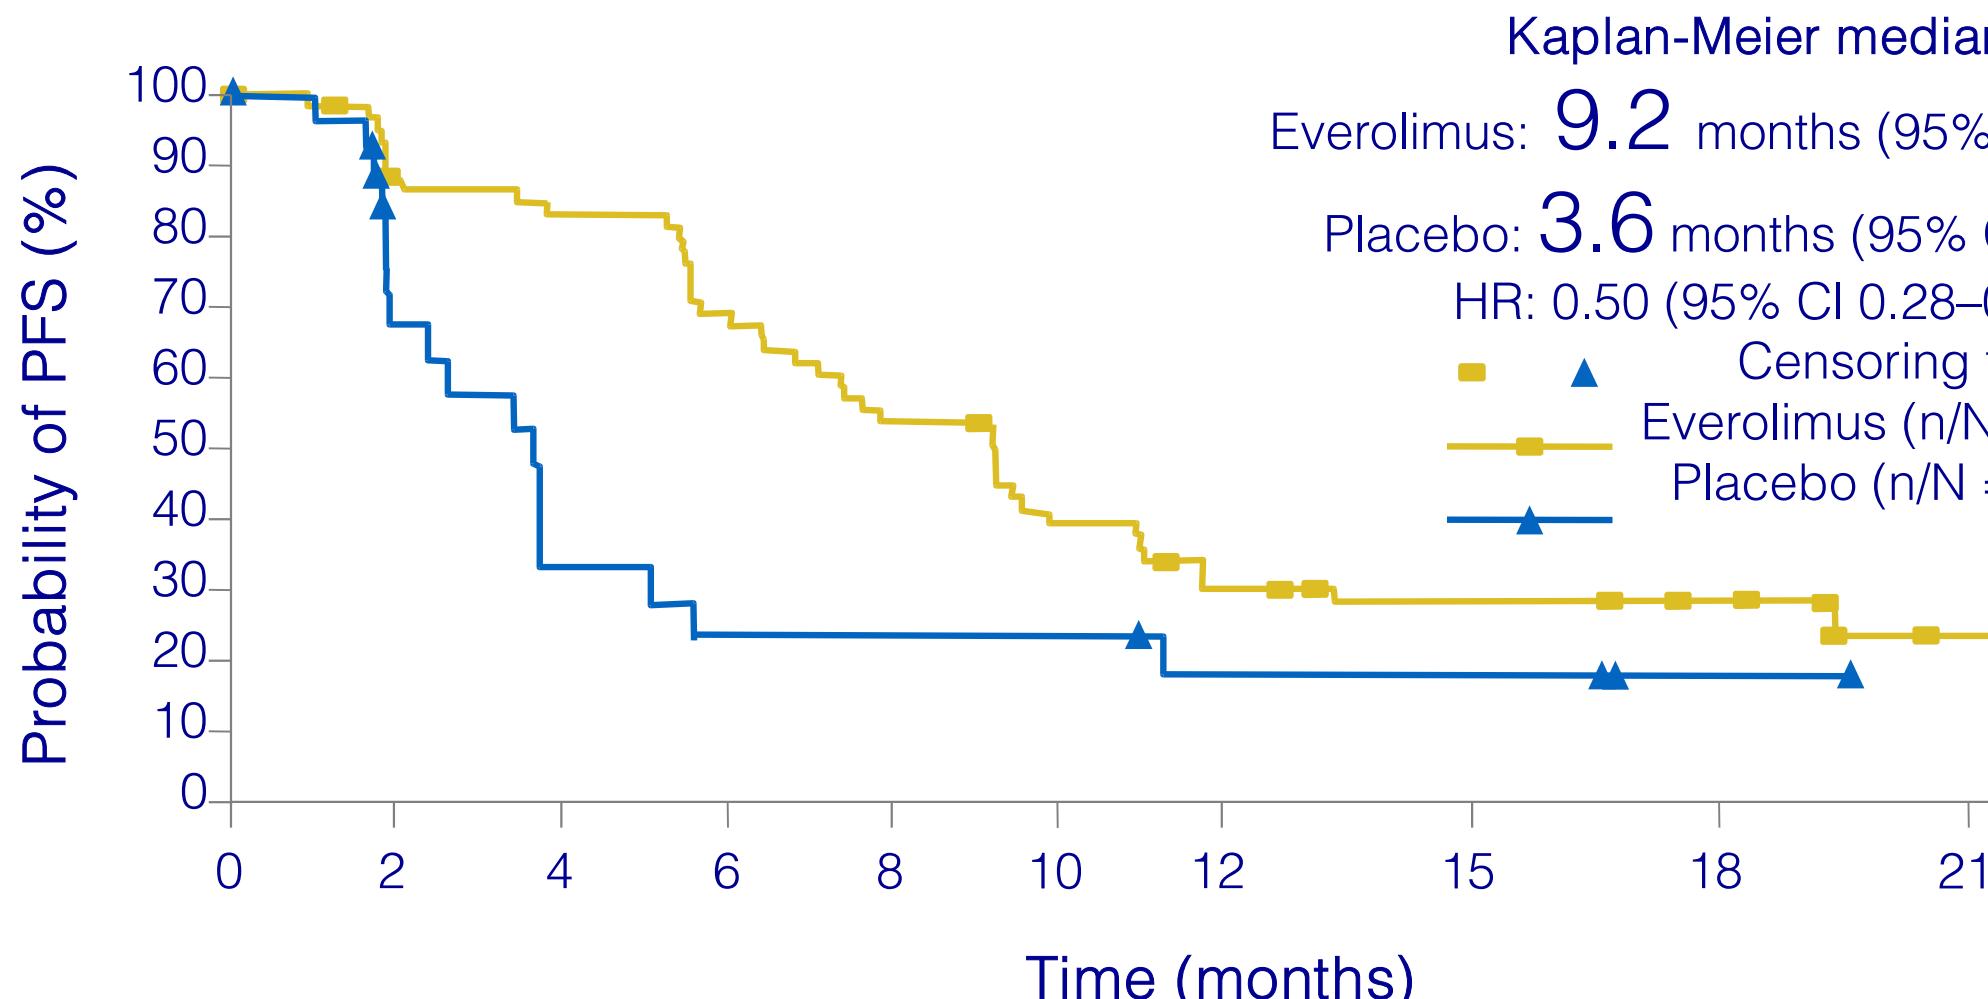

# Trials with Everolimus in lung carcinoids

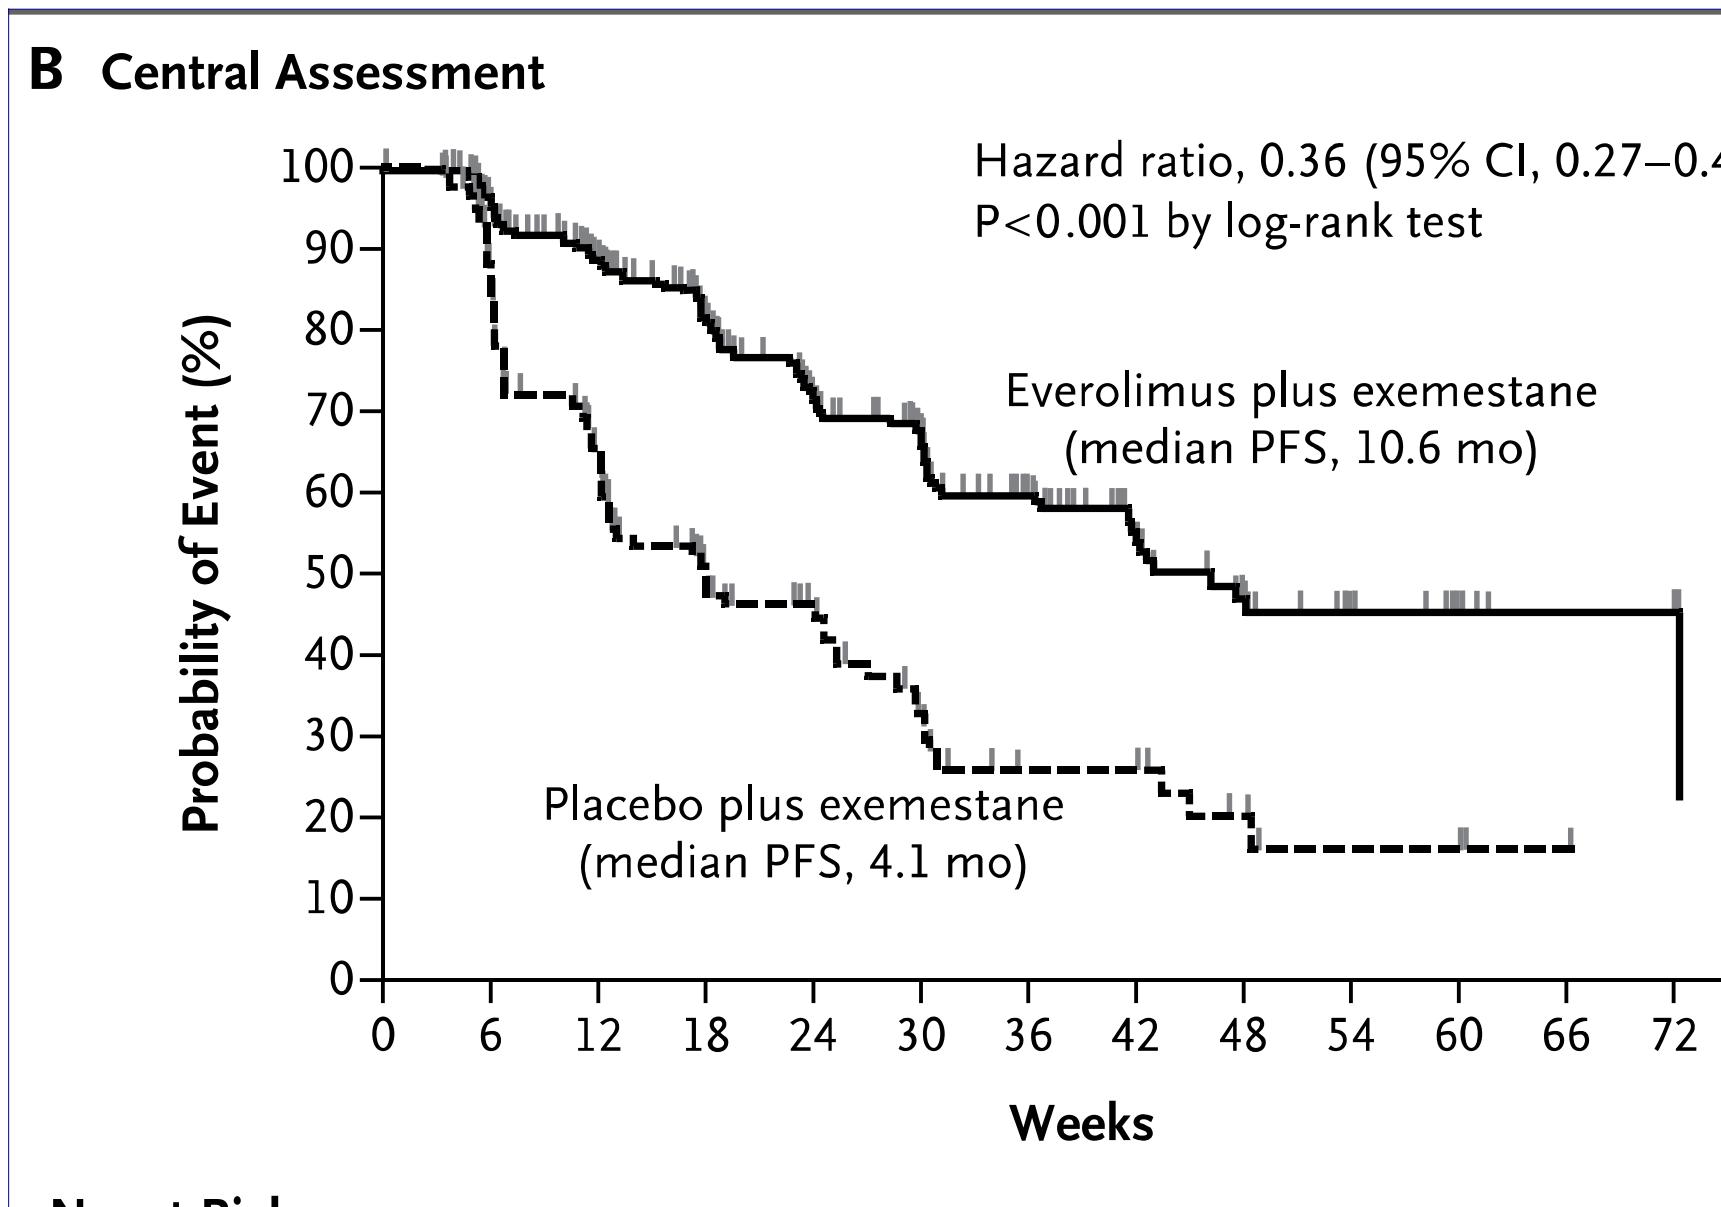

Trial	Experimental arm	Control arm	Type of study	Lung subgroup	Number of lung patients
<b>RAMSETE</b>	EVE	Placebo	Phase II	Non-functioning	22/73
<b>RADIANT-2</b>	EVE + Oct LAR	Oct LAR + Placebo	Phase III	Carcinoid syndrome	44/429
<b>RADIANT-4</b>	Everolimus	Placebo	Phase III	Non-functioning	90/302
<b>LUNA</b>	Pasireotide vs. EVE vs. Pasireotide/EVE	no	Phase II	Functioning and non-functioning	121/121

# RADIANT-4 trial: lung subgroup, 90 pts

PFS treatment effect for lung NET subgroup by central review

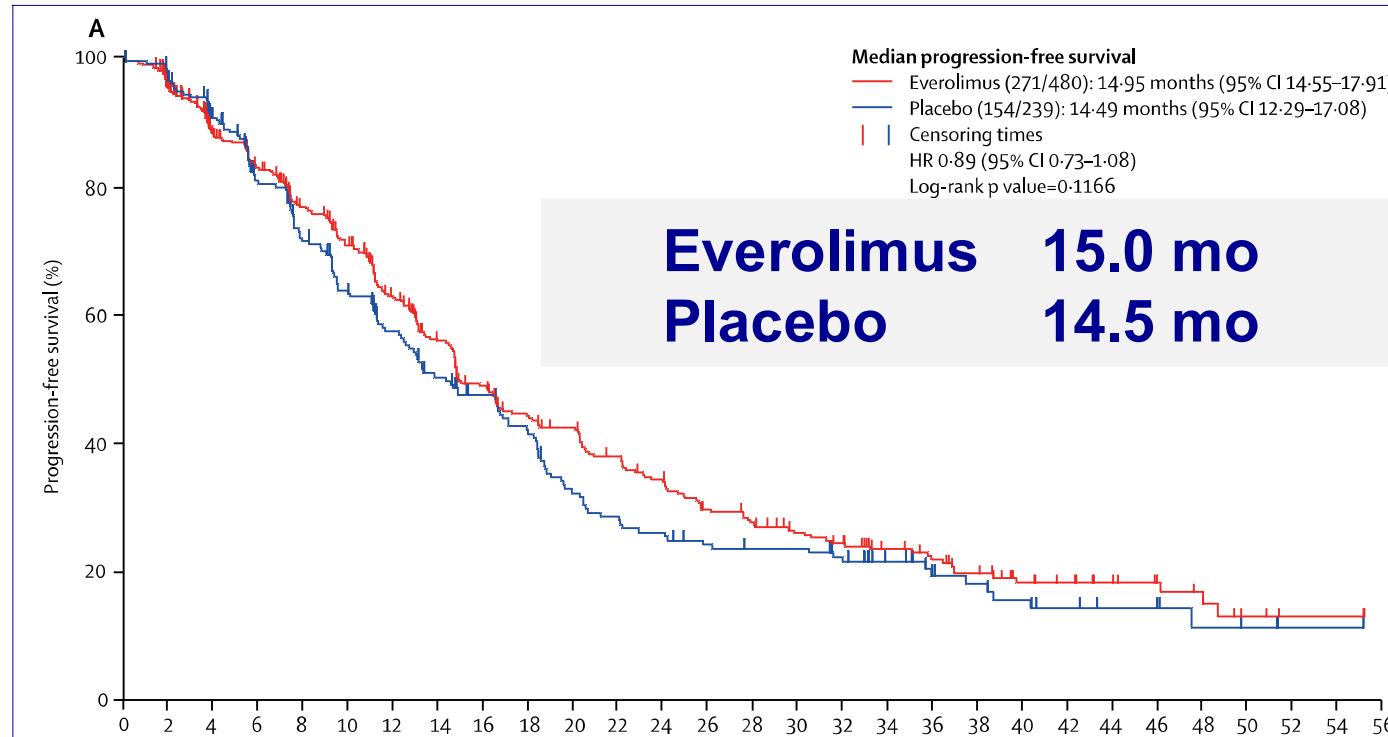

# BOLERO-2 trial: 724 pts with HR+, HER-2 neg, advanced breast cancer, progressing on letrozole or ana

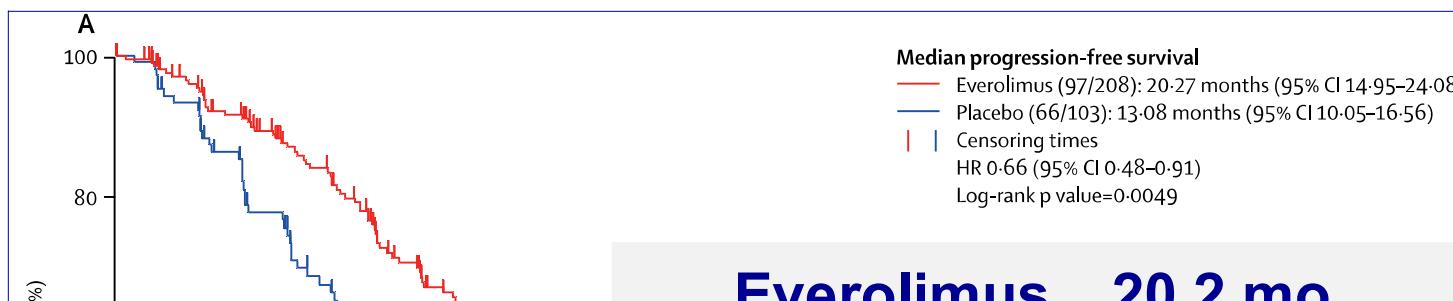

Resistance to trastuzumab has been attributed to aberrant  
of PI3K pathway (loss or disregulation of PTEN)

# BOLERO-1 trial: 719 pts with HER-2+ advanced breast cancer

## PFS in global population

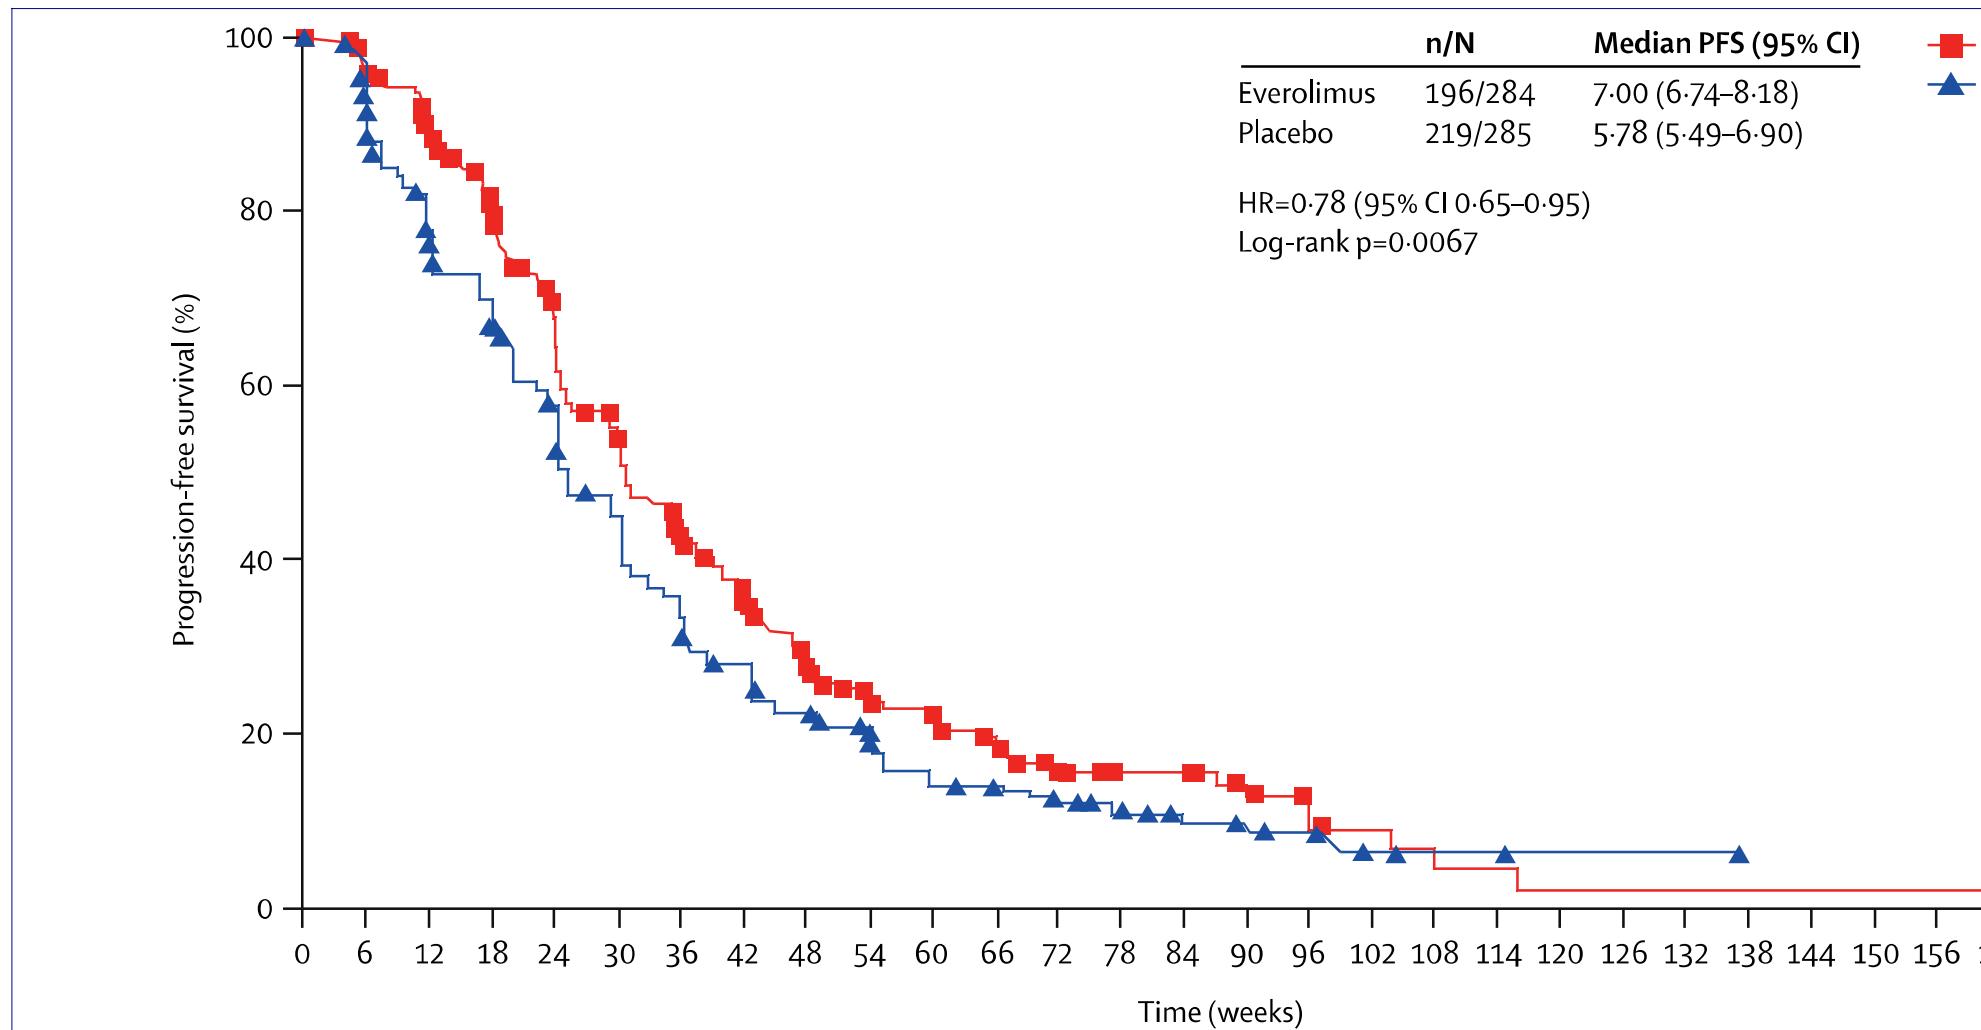

## PFS in HR- sub-population

The p value did not reach the prespecified criteria for statistical significance by a small amount.

# BOLERO-3 trial: 569 pts with HER-2+, trastuzumab-advanced breast cancer

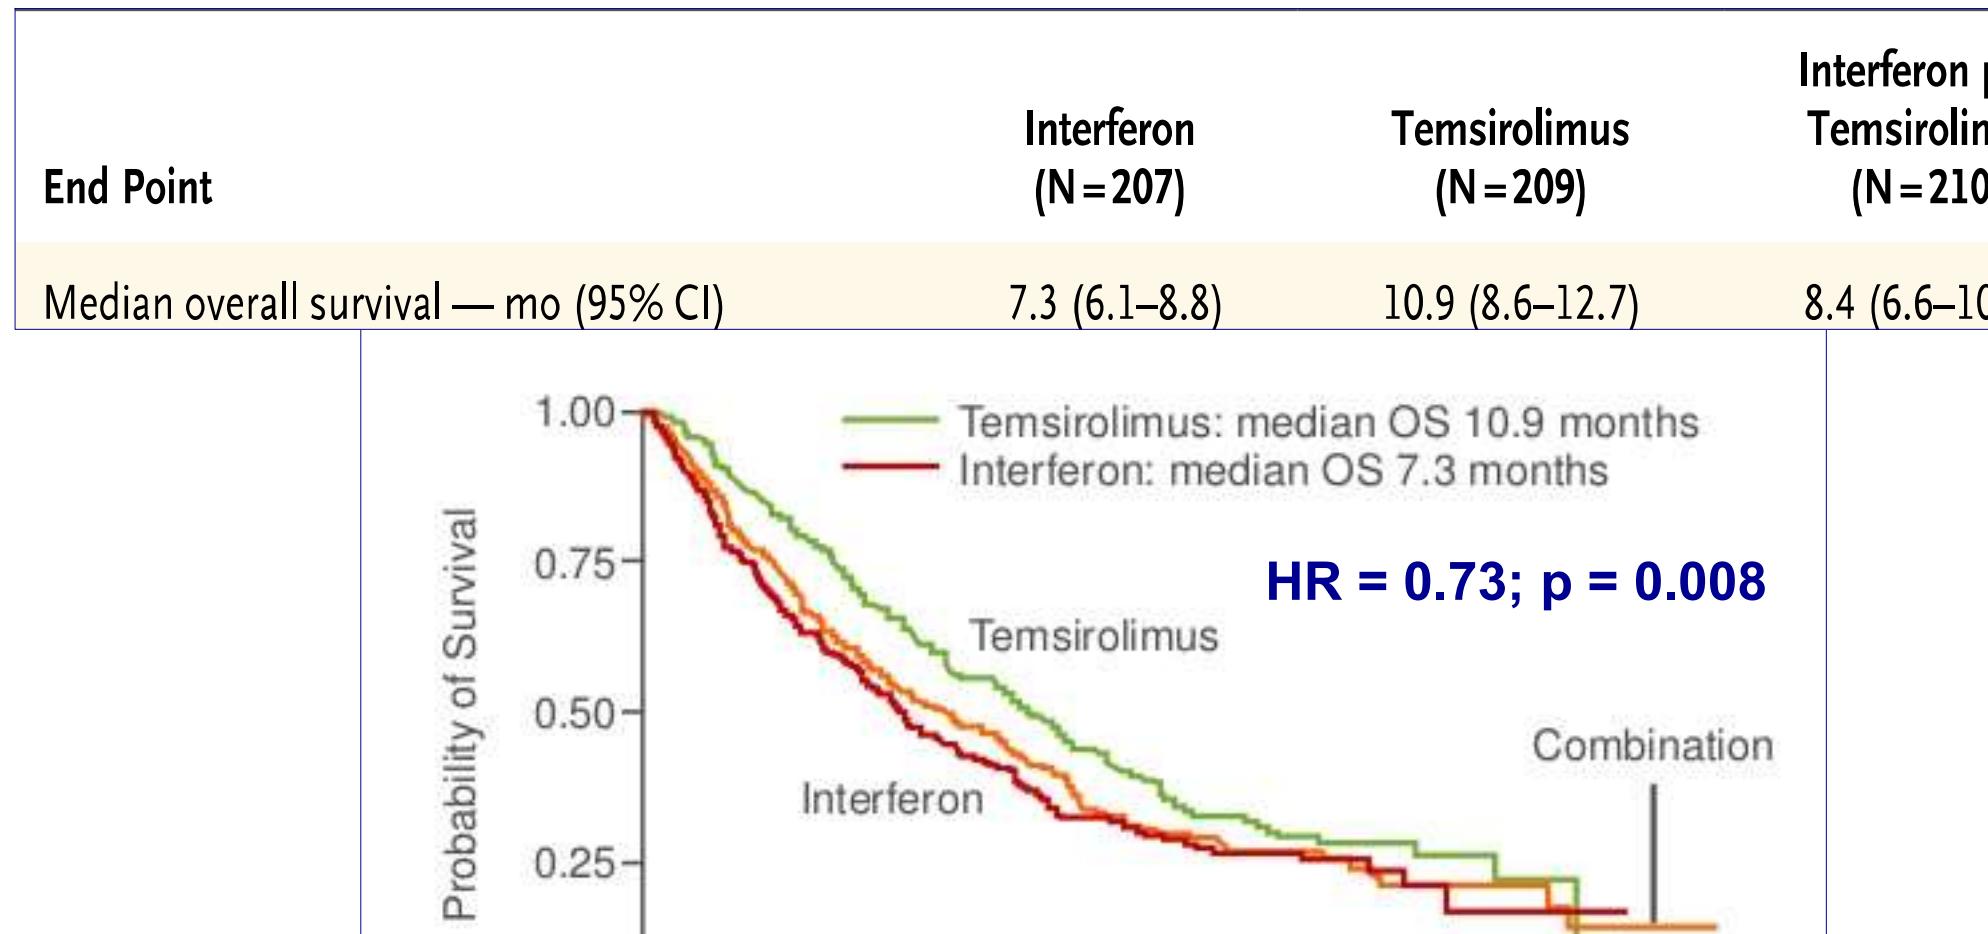

# Randomised phase III trials with Everolimus in breast cancer

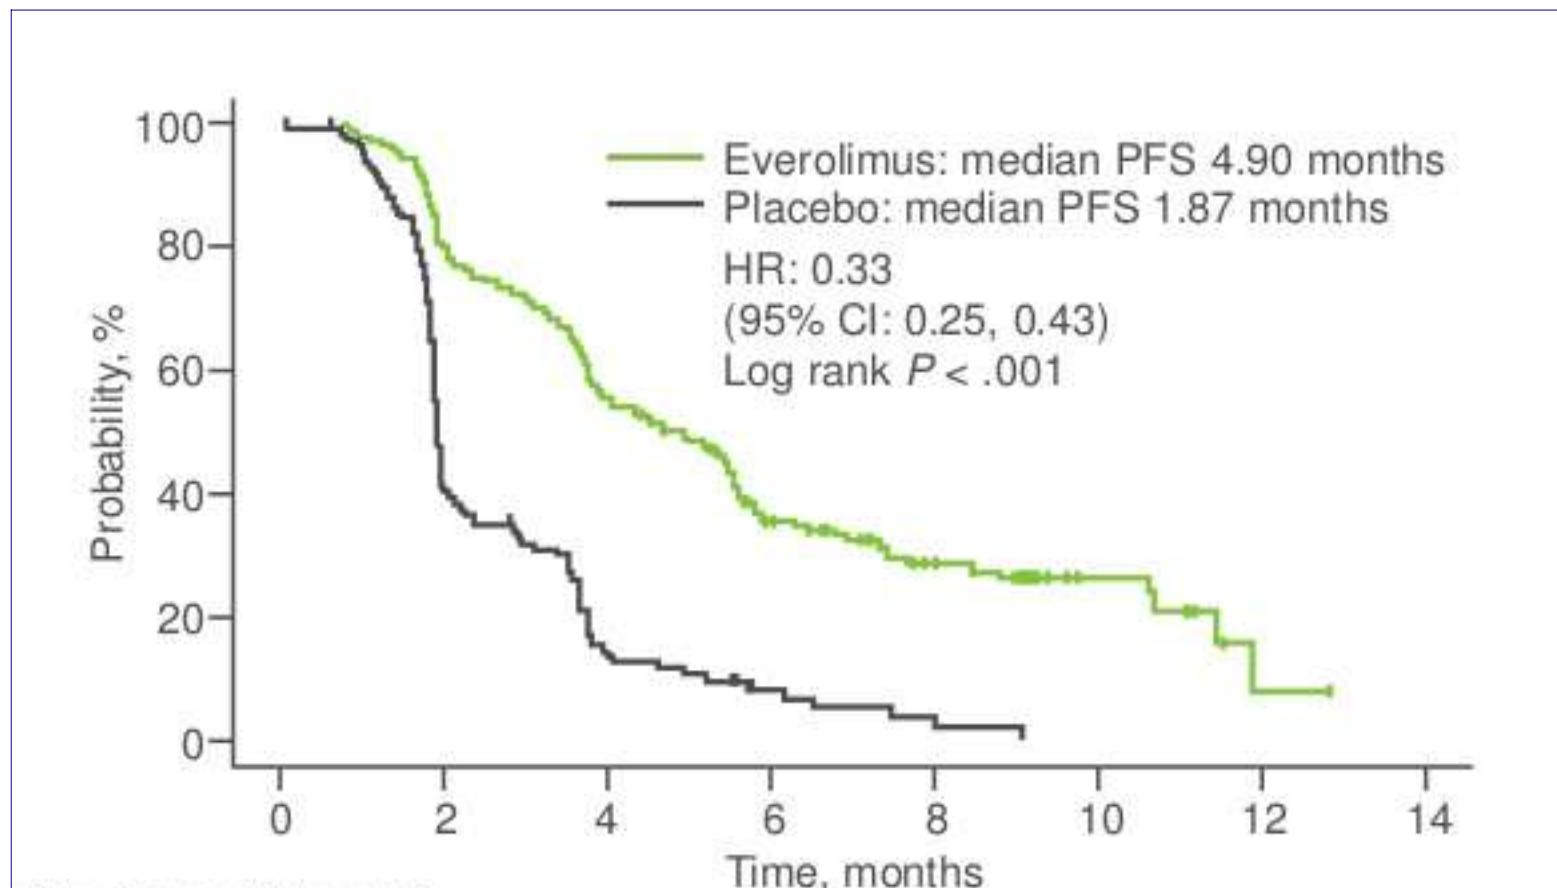

## BOLERO (Breast Cancer Trial of Oral Everolimus)

Trial	N. pts	Popul.	Therapy	Approval
<b>BOLERO-1</b>	<b>719</b>	<b>HER-2+ BC</b>		Not approved for first-line advanced BC
Arm A	480		Paclitaxel/Trastuzumab/EVE	
Arm B	239		Paclitaxel/Trastuzumab/PLB	
<b>BOLERO-2</b>	<b>724</b>	<b>HR+ HER-2+ BC progressing on letrozole/anastrozole</b>		Approved for HR+ HER-2+ BC progressing on letrozole or anastrozole
Arm A	485		EVE + EXE	
Arm B	239		PLB + EXE	
<b>BOLERO-3</b>	<b>569</b>	<b>HER-2+ BC progressing on letrozole or anastrozole</b>		Not approved for HER-2+ BC progressing on letrozole or anastrozole
Arm A	284		EVE/Trastuzumab	

# Temsirolimus, IFN-alpha or both for advanced renal carcinoma: a phase III trial

# RECORD-1 trial: 416 pts with pre-treated meta renal cell carcinoma

# Positive results for cabozantinib and nivolumab compared with everolimus in pre-treated patients with advanced renal cell carcinoma

*Comparison of patient samples prior and post sunitinib treatment suggests that increasing Mcl-1 levels and mTORC1 activity correlate with resistance to sunitinib in patients*

# **Toxicity of mTOR inhibitors**

# Toxicity of everolimus: data from phase III trials

**Table 1.** Incidence of key class-effect toxicities from phase III studies of everolimus in advanced solid tumors

	Metastatic renal cell carcinoma [8]		Neuroendocrine tumors of pancreatic origin [6]		Advanced breast cancer [7]	
	Everolimus + best supportive care (n = 274), %		Everolimus (n = 204), %			
	All Grades	Grade 3/grade 4	All grades	Grade 3/4 <sup>a</sup>		
Stomatitis	44	4/<1	64	7	59	
Rash	29	1/0	49	<1	39	
Noninfectious pneumonitis	14	4/0	17	2	16	
Hyperglycemia	57 <sup>b</sup>	15/<1 <sup>b</sup>	13	5	14 <sup>c</sup>	
Infections <sup>d</sup>	37	7/3	23	2	50 <sup>e</sup>	

<sup>a</sup>Breakdown by grade 3 and 4 not reported.

<sup>b</sup>Based on laboratory values.

<sup>c</sup>Based on investigator-reported adverse events.

<sup>d</sup>Incidence based on system organ class (SOC); includes all infections.

<sup>e</sup>Data from Afinitor prescribing information [2].

The adverse event profile of everolimus is broadly similar across various approved indications.

# Outcomes in Patients With Metastatic Renal Cell Carcinoma Who Develop Everolimus-Related Hyperglycemia and Hypercholesterolemia: Combined Subgroup Analyses of the RECORD-1 and REACT Trials

Petri Bono,<sup>1</sup> Stephane Oudard,<sup>2</sup> Istvan Bodrogi,<sup>3</sup> Thomas E. Hutson,<sup>4</sup> Bernard Escudier,<sup>5</sup> Jean-Pascal Machiels,<sup>6</sup> John A. Thompson,<sup>7</sup> Robert A. Figlin,<sup>8</sup> Alain Ravaud,<sup>9</sup> Mert Basaran,<sup>10</sup> Camillo Porta,<sup>11</sup> Sergio Bracarda,<sup>12</sup> Thomas Brechenmacher,<sup>13</sup> Chinjune Lin,<sup>14</sup> Maurizio Voi,<sup>14</sup> Viktor Grunwald,<sup>15</sup> Robert J. Motzer<sup>16</sup>

Clinical Genitourinary Cancer

Hyperglycemia and hypercholesterolemia were observed in low numbers of patients, and although these events might be associated with improved response to everolimus, the differences were not statistically significant.

# Lung toxicity of mTOR inhibitors: a meta-analysis published trials

Patients treated with mTOR inhibitors have an increase  
of pulmonary toxicity.

The high grade is a rare event but one in 10 patients  
experience grade G1-2 toxicity with a worsening of quality  
of life and interruption of therapy.
