

Vascular Endothelial Syndromes to allo-HSCT

Sergio Siragusa

PROMISE, UniPa

Vascular Endothelial Syndrome (VESs) Early/Late allo-HSCT life-threatening complications

Group of complications without well-established origins, clinically characterized by thrombosis and/or bleeding and MOF

- Sinusoidal Obstruction Syndrome/VOD
- Capillary Leak Syndrome
- Engraftment Syndrome
- Transplant-Associated Microangiopathy (TAM)
- Diffuse Alveolar Haemorrhage (DAH)
- Idiopathic Pneumonia Syndrome

Early onset after HSCT, <u>overlapping clinical manifestations</u>, the absence of well-defined clinical criteria for diagnosis (and consequently an unknown true incidence), the absence of well-established treatments, and the tendency to evolve to an irreversible <u>multiorgan dysfunction</u> <u>syndrome</u>

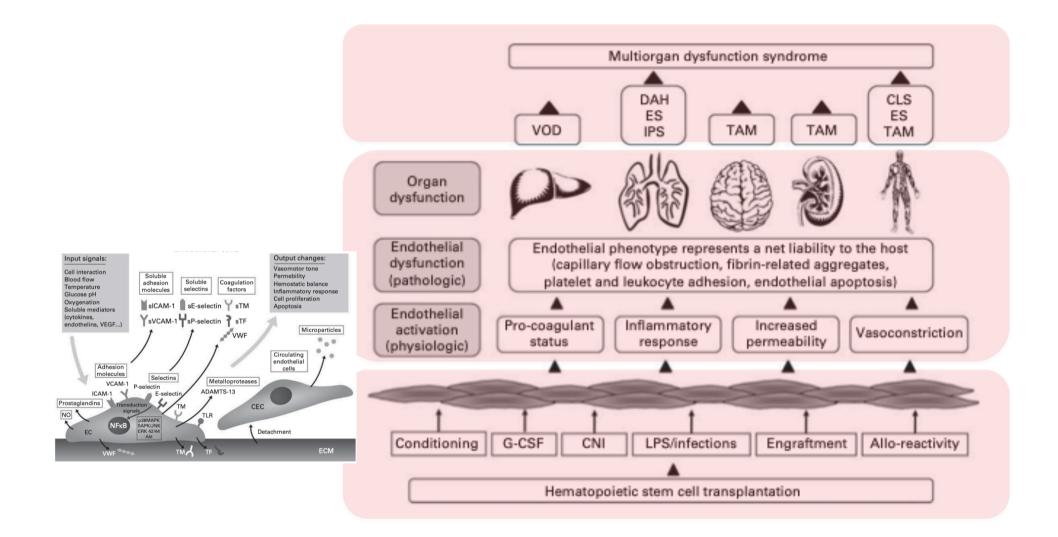

Clinical Manifestation of VESs

Symptoms and signs	VOD	CLS	ES	DAH	IPS	TAM
Usually starting on day:	0–7	7–10	11–15	11–19	18-23	25-120
Fever			-		-	-
Jaundice	-					
Hepatomegaly	-					
Weight gain	-		-			
Oedemas	-	-				
Ascites	-	-				
Lung infiltrates	-	-	-		-

Pathogenesis of VESs after HSCT

Early/Late allo-HSCT life-threatening complications

Group of complications without well-established origins, clically characterized by thrombosis and/or bleeding and MOF

Sinusoidal Obstruction Syndrome/VOD

- •Capillary Leak Syndrome
- •Engraftment Syndrome

•Transplant-Associated Microangiopathy (TAM)

- •Diffuse Alveolar Haemorrhage (DAH)
- Idiopathic Pneumonia Syndrome

Early onset after HSCT, overlapping clinical manifestations, the absence of well-defined clinical criteria for diagnosis (and consequently an unknown true incidence), the absence of well-established treatments, and the tendency to evolve to an irreversible multiorgan dysfunction syndrome

Early/Late allo-HSCT life-threatening complications

Group of complications without well-established origins, clically characterized by thrombosis and/or bleeding and MOF

Sinusoidal Obstruction Syndrome/VOD

- •Capillary Leak Syndrome
- •Engraftment Syndrome
- •Transplant-Associated Microangiopathy (TAM)
- •Diffuse Alveolar Haemorrhage (DAH)
- •Idiopathic Pneumonia Syndrome

Early onset after HSCT, overlapping clinical manifestations, the absence of well-defined clinical criteria for diagnosis (and consequently an unknown true incidence), the absence of well-established treatments, and the tendency to evolve to an irreversible multiorgan dysfunction syndrome

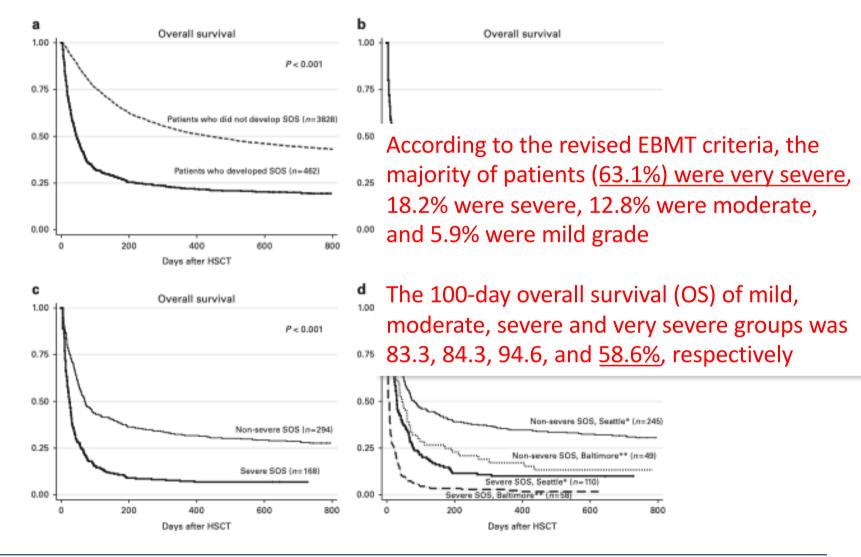

SOS/VOD

- Sinusoidal obstruction syndrome (SOS)(Veno Occlusive Disease (VOD) is a potentially lethal complication of HSCT
- Its reported incidence ranges from <u>5% to over 50%</u>. This variability in SOS incidence may result from the use of different diagnostic criteria (actual est. 10%)
- SOS usually occurs within the <u>first 3 weeks after allo-HSCT</u> as a result of endothelial and hepatic damage caused by the <u>conditioning regimen</u>
- Because SOS is associated with low <u>platelet count and ascites</u>, it is usually diagnosed by clinical manifestations rather than liver biopsy

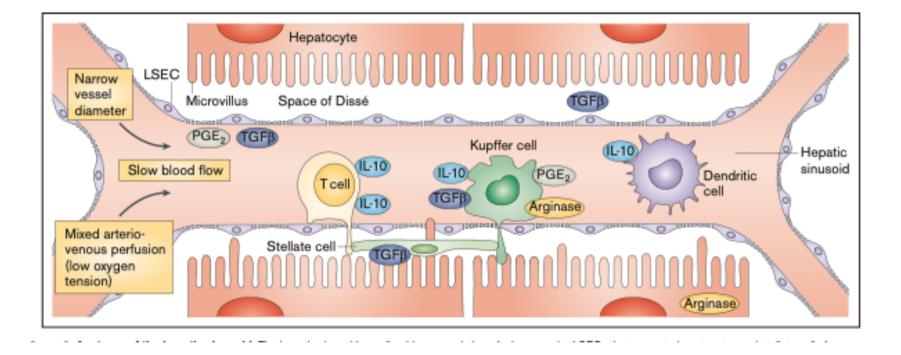

Overall survival in patients with SOS following HSCT

Yoon JH et a. Bone Marrow Transplant. 2019 Aug;54(8):1361-1368

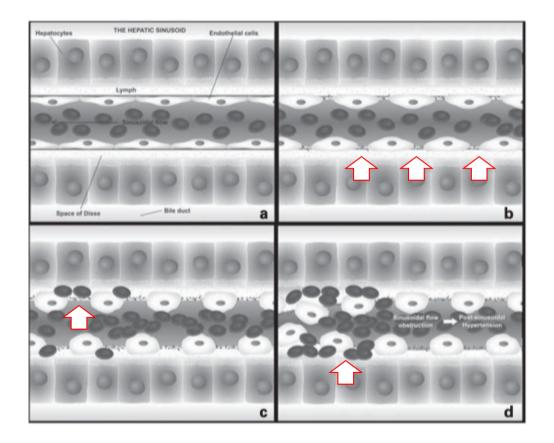

Anatomy of the hepatic sinusoid

SOS/VOD pathogenesis

(1) Sinusoidal ECs damaged during conditioning round up favouring the appearance of <u>gaps in the</u> <u>sinusoidal barrier;</u>

(2) <u>RBC begin to penetrate</u> into the space of Disse detaching the endothelial lining;

(3) The sloughed sinusoidal lining cells embolize downstream and obstruct the sinusoidal flow
 (sinusoidal obstruction syndrome).

SOS/VOD rCriteria/Risk Factors

Adult Criteria			
Classical VOD/SOS (Baltimore Criteria)	Late-Onset VOD/SOS		
 Onset in the first 21 days after HSCT 	 Onset beyond day 21 post- HSCT 		
 Bilirubin ≥2 mg/dL plus 2 or more of: 	 Classical VOD/SOS (Baltimore criteria) 		
Painful hepatomegaly	OR		
• Weight gain >5%	 Histologically proven VOD/SOS 		
Ascites	OR		
	 Two or more of the following: 		
	 Bilirubin ≥2 mg/dL (or 34 μmol/L) 		
	 Painful hepatomegaly 		
	• Weight gain >5%		
	Ascites		
	AND		
	 Hemodynamic and/or ultra- sound evidence of VOD/SOS 		
Pediatric Criteria			
No limitation for time of onset of VOE	/SOS		
 Presence of ≥2 of the following*: 			
 Unexplained consumptive and trans thrombocytopenia[†] 	sfusion-refractory		
 Otherwise unexplained weight gain use of diuretics or a weight gain >5% all 	, ,		
 Hepatomegaly[‡] (best if confirmed b 	y imaging) above baseline value		
 Ascites¹ (best if confirmed by imaging) 	ng) above baseline value		
 Rising bilirubin from a baseline value bin ≥2 mg/dL within 72 h 	ue on 3 consecutive days or biliru-		

Patient-Related Factors	OR	Transplantation-Related Factors	OR
Young age [5,24]	1.7-9.5	Allogeneic HSCT [24]	2.8
Preexisting hepatic condition		Unrelated/HLA mismatch [24]	1.4
Previous liver disease [24]	3.4		
Elevated AST/ALT pre-HCST [24]	2.4-4.6		
Hepatitis C-positive [26]	2.2		
Underlying diagnosis		Previous HSCT [24]	1.9
Leukemia [24]	2.2		
Previous treatment		High-intensity/MAC regimens	2.3-7.9
Gemtuzumab ozogamicin [24]	19.8	Busulfan plus cyclophosphamide [24]	3.9-5.
Inotuzumab ozogamicin [6],*	22	Fludarabine [24]	4.0
		TBI-based [26]	1.73
		Busulfan-based [26,30]	2.43
		Busulfan-thiotepa [36]	8.8
Previous abdominal radiation [24]	2.9	Total body irradiation [24]	
		>12 Gy plus cyclophosphamide	2.8
Impaired pulmonary function [24]	2.4	GVHD prophylaxis [24]	
Genetic predisposition [24]		Sirolimus + methotrexate + tacrolimus	~3
GSTM1 null genotype	4.1	Methotrexate + cyclosporine	3.3
KPS score <90% [24]	2.7	Cyclosporine	4.2
Ferritin >1000 ng/mL pre-HSCT [24]	3.1	Horse ATG [37]	3.5
Ferritin ≥950 ng/mL pre-HSCT [36]	8.8		
Sepsis post-HSCT [24]	4.1	Trough serum tacrolimus levels above target range (5-10 ng/mL) [21]	NR
ECOG performance status 2-4 (vs 0-1) [26]	1.9	Early day of neutrophil engraftment [5]	1.4
Advanced disease status [26]	1.5-1.7		
Acute kidney injury [21]	NR		
Platelet refractoriness [21]	NR		
High INR [21]	NR		

SOS/VOD biomarkers (proposed)

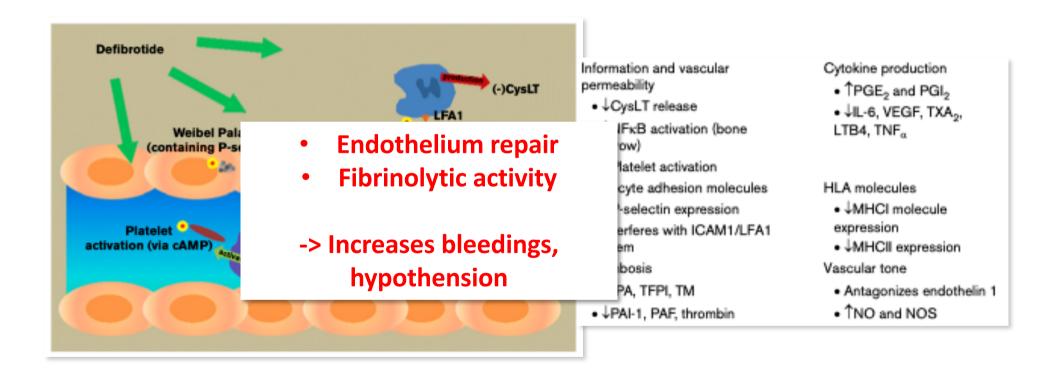

Hematological markers highly aspecific!

_	
Ľ	Biomarker
	Broad-spectrum/multiple mechanism
	Panel of changes in tumorogenicity-2, angiopoieten- 2, L-ficolin, hyaluronic acid, and VCAM-1
	↓ L-ficolin plasma level
1	Genetic polymorphisms
	MTHFR C677T/A1298C
	Heparanase single nucleotide polymorphisms
1	Hematologic and endothelial
	↓ Protein C levels
	↓ Antithrombin III levels
	↓ Type III procollagen and tPA
	↑ PAI-1 antigen levels
	↑ Extra-cellular endothelial vesicles CD144*
	↑ vWF, thrombomodulin, soluble IAM-1*
	Hepatic/splenic
	† Maximum total serum bilirubin/bilirubin increase at any point in time
	↑ Total bilirubin, D-dimer
	† Hepatocyte growth factors/with/without IL-6
	↑ APRI
	† Splenic volume
1	↑ Panel of liver fibrosis indices: API, APRI, PSR, FIB-4 ¹
	Inflammatory/immune response
	↑ IL-6, IL-10, TNF-α plasma levels ¹
1	↑ IL-6 plasma level at + day 7 post-HSCT
1	⊥ IGF and IGFBP-3 plasma levels

SOS/VOD treatment (Defibrotide)

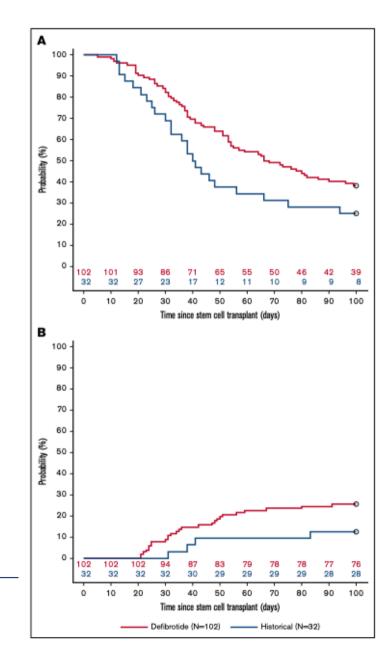

Defibrotide phase 3 study

Primary end points of phase 3 study (not randomized) in defibrotide (6.25 mg/Kg every 6 hs, **25 mg/kg daily**) treated patients (n. 102) vs historical controls receiving supportive treatment.

- (A) Kaplan-Meier estimates of overall survival distribution
- (B) Complete response (defined as total bilirubin < 2 mg/dL and resolution of MOD/MOF) <u>at day 100 following HSCT</u>

Defibrotide pooled analysis (I)

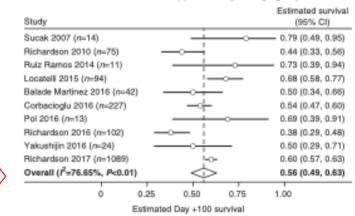

Patients treated with any dose of defibrotide

Study	Estimated survival (95% CI)
Richardson 1998 (n=19)	0.32 (0.13, 0.57)
Chopra 2000 (n=40)	0.57 (0.41, 0.73)
Richardson 2002 (n=88)	0.35 (0.25, 0.46)

Can we prevent SOS/VOD?

The HARMONY Trial

Clinicaltrials.gov. NCT02851407: Study comparing efficacy and safety of **defibrotide vs best supportive care** in the prevention of hepatic veno-occlusive disease in adult and pediatric patients.

Available from: https://clinicaltrials.gov/ct2/show/NCT02851407.

Early/Late allo-HSCT life-threatening complications

Group of complications without well-established origins, clically characterized by thrombosis and/or bleeding and MOF

- Sinusoidal Obstruction Syndrome/VOD
- •Capillary Leak Syndrome
- •Engraftment Syndrome

•Transplant-Associated Microangiopathy (TAM)

- •Diffuse Alveolar Haemorrhage (DAH)
- •Idiopathic Pneumonia Syndrome

Early onset after HSCT, overlapping clinical manifestations, the absence of well-defined clinical criteria for diagnosis (and consequently an unknown true incidence), the absence of well-established treatments, and the tendency to evolve to an irreversible multiorgan dysfunction syndrome

TMA: Clinical/Lab presentation

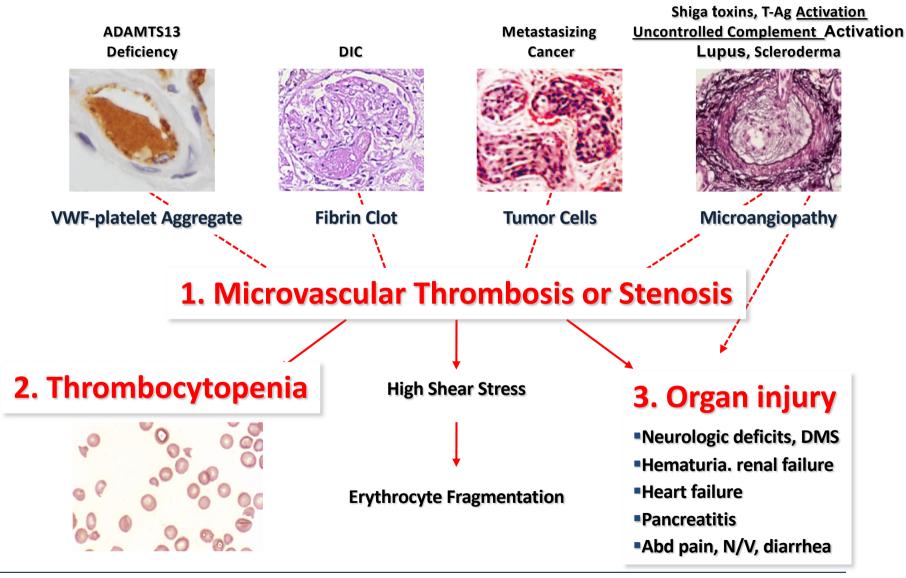

- Q. Thrombotic occlusion of the microvasculature (often asy-oligosymptomatic), from different causes, leading to:
- Hemolytic anemia with elevation of LDH and negative direct Coomb's test
- Thrombocytopenia
- Fragmentation of red blood cells -> Schistocytes
- Normal baseline coagulation (lab)

Thrombotic MicroAngiopathies (TMAs)

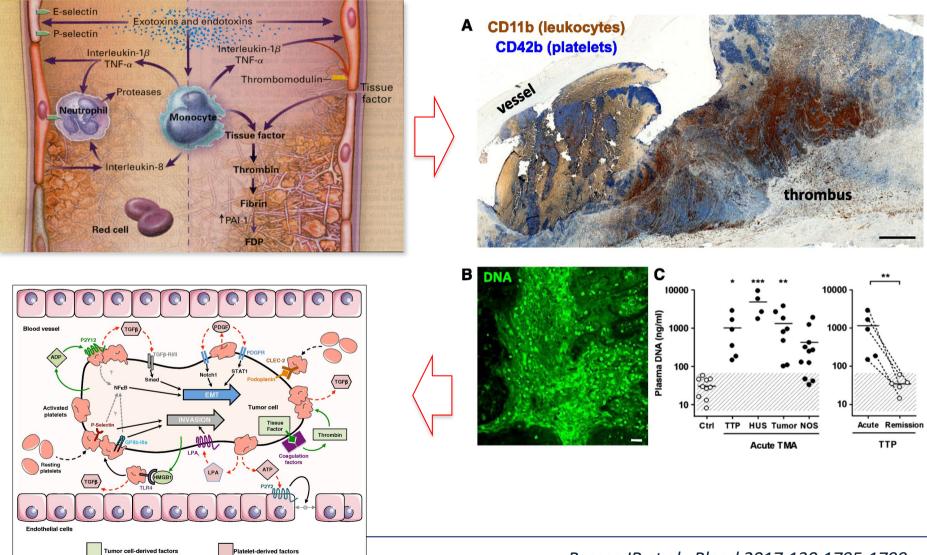

TMAs – Costellation of diseases for unique symptoms

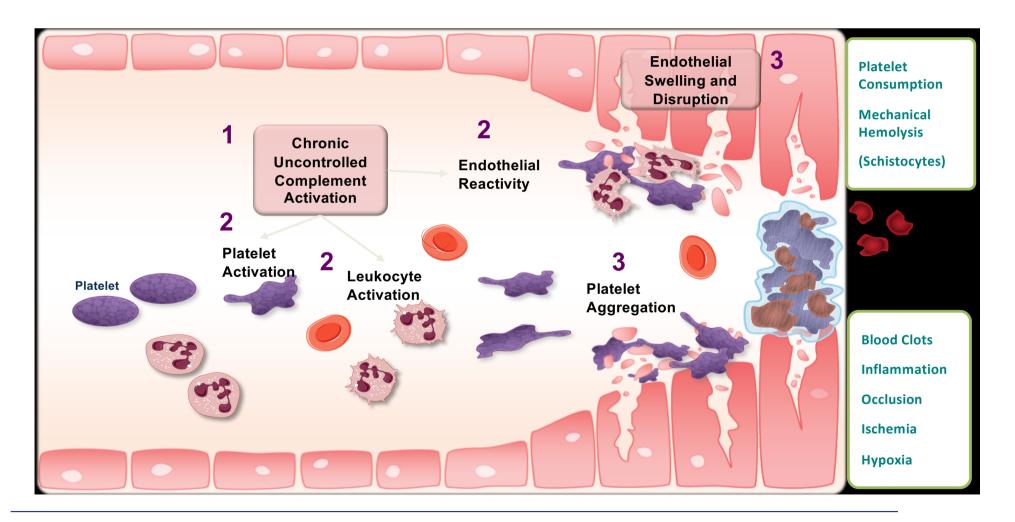

Interaction between coagulation factors, leukocytes & platelet in cancer/inflammation

Byrnes JR et al. Blood 2017;130:1795-1799

Link beteween Uncontrolled Complement, Platelet, Endothelial, and Leukocyte Activation Leading to TMA

Modified from Desch K et al. *JASN*. 2007;18:2457-2460. Modified from Licht C et al. *Blood*. 2009;114:4538-4545. Modified from Noris M et al. *NEJM*. 2009; 361:1676-1687. Modified from Stahl A et al. *Blood* 2008;111:5307-5315. Modified from Camous L et al. *Blood*. 2011;117:1340-1349.

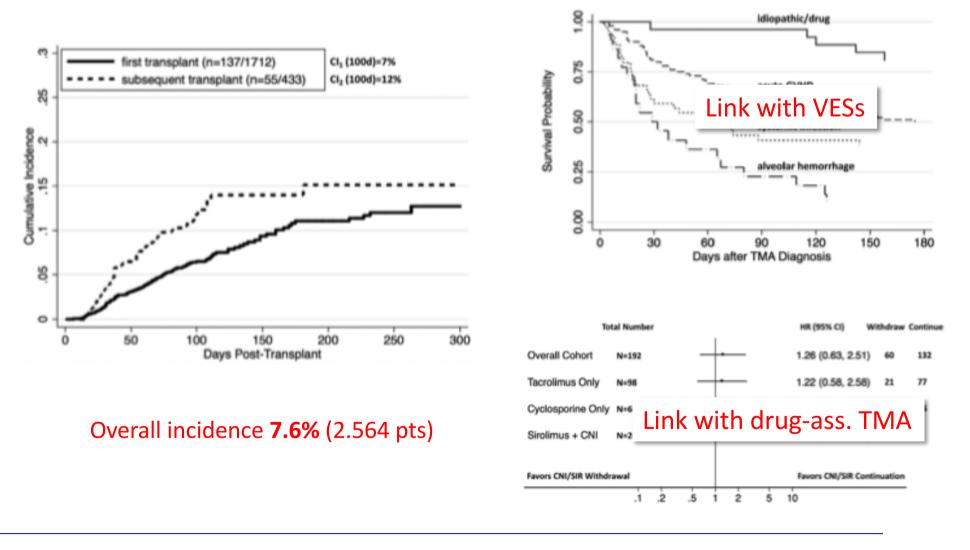

TMAs other than TTP

Disorder	Pathophysiology
TMA-Shiga toxin mediated	Direct endothelial damage with apoptosis due to effects o Shiga toxin
TMA-complement mediated	Endothelial damage from unregulated complement activation resulting from the development of anti-facto H autoantibodies or mutations leading to abnormal complement regulatory proteins or abnormal complement factors
TMA-hematopoietic stem cell	Endothelial damage due to infection, chemotherapy,
transplantation associated	radiation therapy, or graft-versus-host disease due to transplant. Of note, a significant percentage of affected
All these 3 condit	tions are present in allo-HSCT
Thin-drug associated	Mechanism varies depending on drug and includes direct endothelial damage as well as the development of ADAMTS13 autoantibodies
TMA-malignancy associated	Activation of coagulation by tumor tissue factor expression Possible complement regulatory pathway mutations
TMA-Streptococcus pneumonia associated	Exposure of normally hidden endothelial antigens by bacterial neuramidase resulting in complement mediated endothelial damage
TMA-coagulation mediated	Mutations in DGKE, plasminogen, and thrombomodulin resulting in thrombosis and complement activation
HELLP syndrome	Mutations in alternate complement pathway regulatory elements

HSCT-related TMA

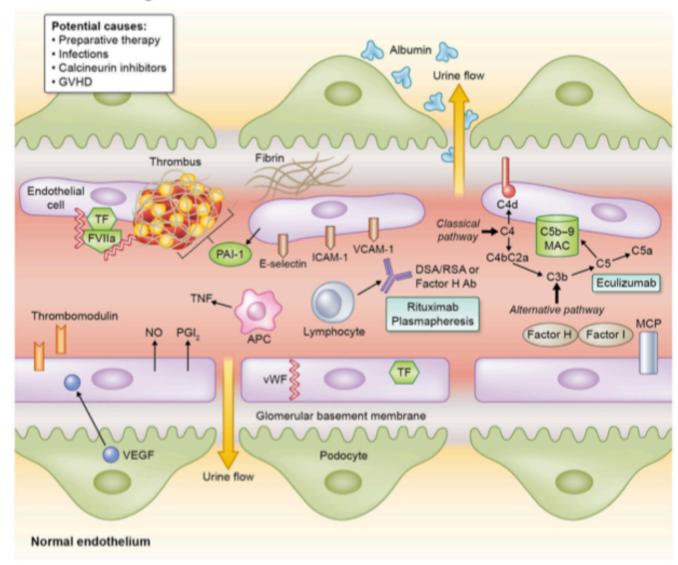

Ang L et al. Biol Blood Marrow Transplant 2019;25:570-576

Activated and damaged endothelium in TA-TMA

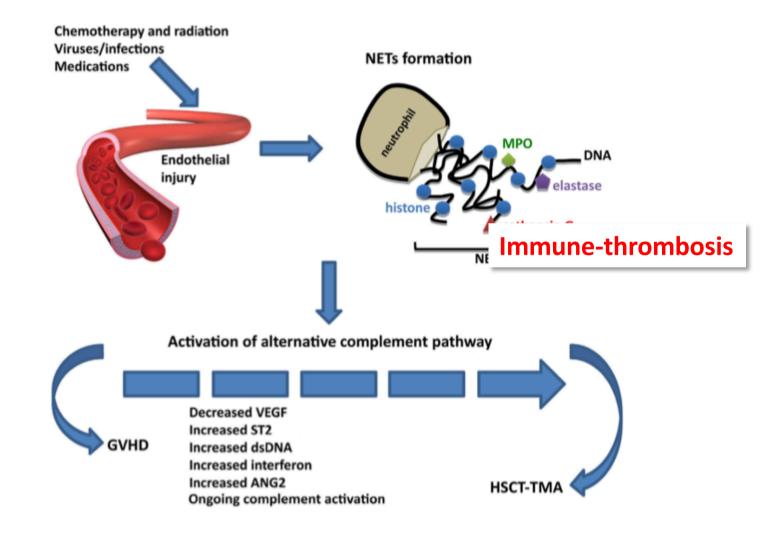

HSCTmediated TMAs (glomerular endothelium)

Wanchoo R et al. Am J Kidney Dis. 2018; 72(6):857-865

Proposed mechanism of how GVHD could be linked with HSCT-TMA

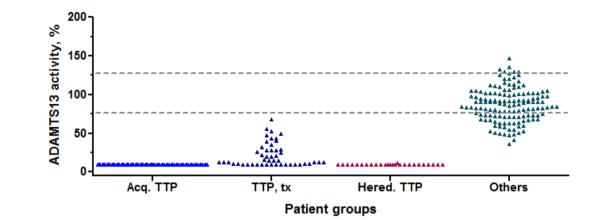

Wanchoo R et al. Am J Kidney Dis. 2018; 72(6):857-865

How to distinguish (lab/clinical) TMAs?

Lab (no too much):

- > ADAMTS13 for ruling out TTP
- Coag. test for ruling out
 DIC in some cases
 (complement testing unusefull)

	Cancer-associated thrombotic microangiopathy	Chemotherapy-associated thrombotic microangiopathy
Disseminated cancer	Yes	No
Renal involvement	Mild/absent	Mild/severe
Disseminated intravascular coagulopathy	Present	Absent
Circulating erythroblasts	Present	Absent
Clinical presentation	Thrombotic thrombocytopenic purpura-like disease	Hemolytic-uremic syndrome-like disease
Treatment	Chemotherapy	Stop chemotherapy Supportive care Specific treatments

Clinic (even less):

 - > some differences among cancer-related TMAs (but not others)

Grange S et al. Nephrologie & Therapeutique 13S (2017) S109–S113

Can we prevent allo-HSCT-related TMA?

Lessons from VESs/TMAs

VESs/TMAs are variable entities in presentation and <u>course</u>:

- Distinction among TMAs is not clinically feasible
- Distinction among VESs is not clinically feasible
- Thrombocytopenia may not be profound in severe cases
- Organ dysfunction may result directly from vascular injury and increased permeability without thrombosis or vascular stenosis
- Absence of reliable biomarkers (except TTP)
- Treatment of TMAs <u>other than TTP</u> is still unsatisfactory
- Treatment of severe SOS/VOD (**Defibrotide**) should start asap (Baltimore criteria)
