Table 2 Common biological categories in gene signatures

| | NF-κB signaling | Chromosomal instability | Ubiquitin-proteasome system |
|-----------|---|---|------------------------------------|
| Cluster 1 | BTRC, CULT1, SRC, NFKBIA, NFKB1, NFKB2, REL, RELB, CHUK | CDC20, BUB1, MLFPIP, CENPC1, MIS12, PMF1, NDC80, RAD21, STAG1 | BTRC, CULT1, PSMB9, PSMC2, PSMF1 |
| Cluster 2 | BTRC, SRC, NFKBIA, TNFRSF10B, IL6R | MIS12, DSN1, MLFPIP, CENPC1, PLK1, NEDD1, TUBGCP5, TUBGCP6 | BTRC, PSMB3, PSMC3 |
| Cluster 3 | FBXW11, AKT2, TNFR1A | CDC16, CDC27, NEDD1, TUBGCP5, KIF2B, KIF2C | FBXW11, PSMC3, PSMD9 |

All signatures have genes that can be grouped into the following categories: NF-κB signaling, chromosomal instability and ubiquitin-proteasome system

❖ Prognosi molto favorevole:

- *PML-RAR α* , *CEBPA* double-mutated.

❖ Prognosi favorevole:

- *RUNX1-RUNX1T1*, *CBFB-MYH11*,
NPM1 mut/FLT3-ITD-

❖ Prognosi intermedia:

- *CEBPA* single-mutated, *FLT3-ITD+*, casi wild-type.

❖ Prognosi sfavorevole:

- Mutazioni in *MLL-PTD* e/o *RUNX1* e/o *ASXL1*

❖ Prognosi molto sfavorevole:

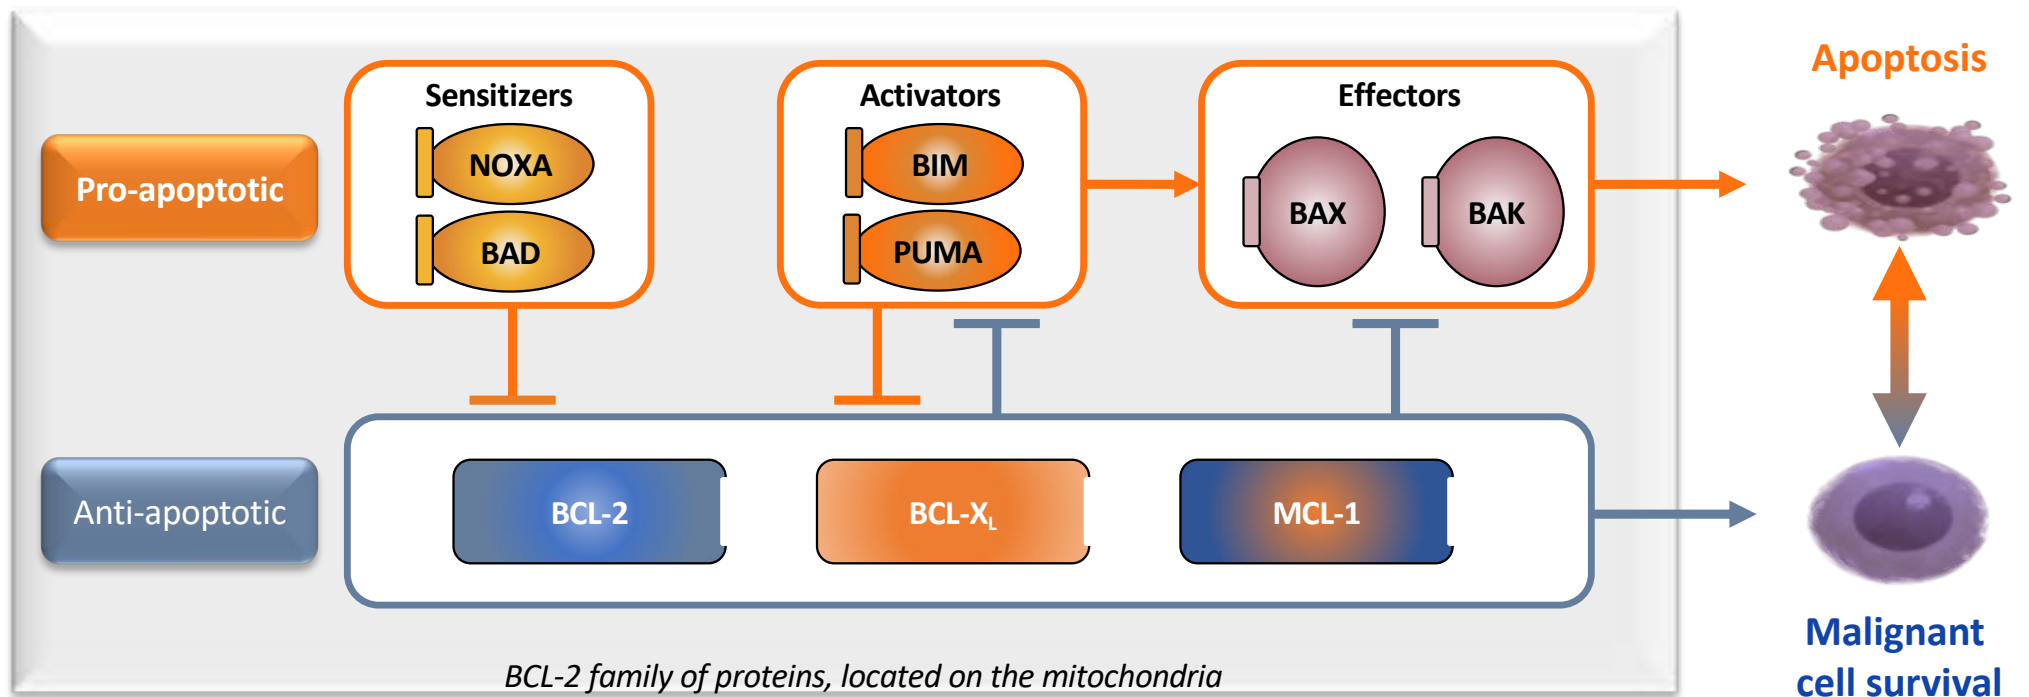

- Mutazioni in *TP53*.

Grossmann et al., Blood, 2012

Apoptosis Is Regulated by the BCL-2 Family of Proteins

BCL-2 family proteins include both pro-survival (anti-apoptotic) and pro-death (pro-apoptotic) proteins with opposing functions¹⁻⁴

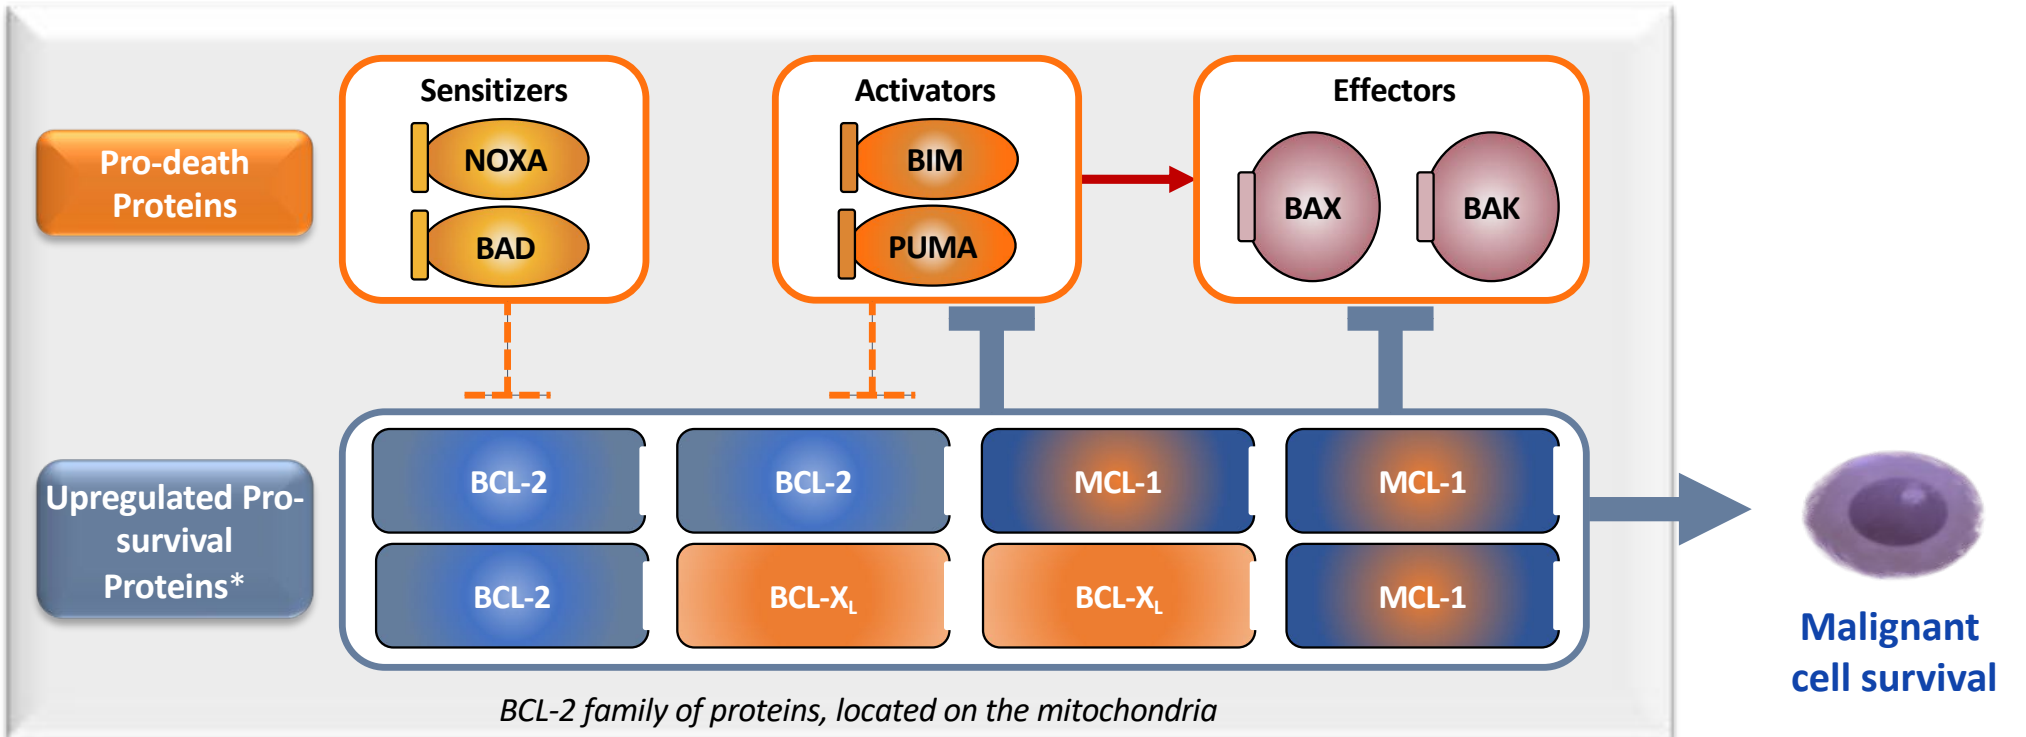

Key: → Activation —| Inhibition

* Also includes: BCL-w and BFL-1/BCL2-A1.
BCL-2, B-cell lymphoma 2.

1. Plati J, et al. *Integr Biol (Camb)* 2011; **3**:279–296; 2. Czabotar PE, et al. *Nat Rev Mol Cell Biol* 2014; **15**:49–63;
3. Leveson JD, et al. *Cancer Discov* 2017; **7**:1376–1393; 4. Valentin R, et al. *Blood* 2018; **132**:1248–1264.

Malignant Cells Can Evade Apoptosis by Upregulating BCL-2 and Other Pro-survival Proteins

Malignant cells often evade apoptosis by upregulation of pro-survival proteins, such as BCL-2, MCL-1, and BCL-X_L

Key: → Activation —| Inhibition

* Also includes: BCL-w and BFL-1/BCL2-A1.

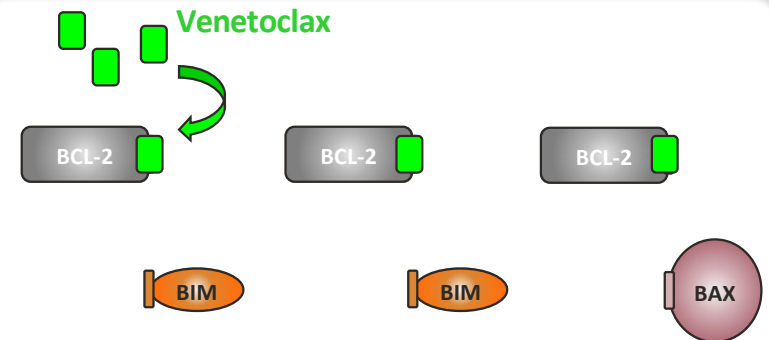

1. Levenson JD, et al. *Cancer Discov* 2017; **7**:1376–1393;
 2. Czabotar PE, et al. *Nat Rev Mol Cell Biol* 2014; **15**:49–63; 3. Adams JM & Cory S. *Oncogene* 2007; **26**:1324–1337;
 4. Letai A, et al. *Cancer Cell* 2002; **2**:183–192; 5. Certo M, et al. *Cancer Cell* 2006; **9**:351–365.

Venetoclax Is a Highly Selective, Potent, Oral BCL-2 Inhibitor Designed to Induce Apoptosis in Malignant Cells

Pro-survival proteins (e.g. BCL-2) sequester pro-death proteins by binding to their **BH3 motifs**^{1,2}

Venetoclax competes for binding to pro-survival proteins, freeing pro-death proteins³⁻⁵

1. Plati J, et al. *Integr Biol (Camb)* 2011; **3**:279–296; 2. Czabotar PE, et al. *Nat Rev Mol Cell Biol* 2014; **15**:49–63; 3. Souers AJ, et al. *Nat Med* 2013; **19**:202–208 (incl. suppl.); 4. Oltersdorf T, et al. *Nature* 2005; **435**:677–681; 5. Tse C, et al. *Cancer Res* 2008; **68**:3421–3428.

Venetoclax Has a High Selectivity for BCL-2, Which Correlates with Its Anti-tumor Activity

Venetoclax binding
affinity by TR-FRET

| Protein | K_i (nM) |
|--------------|-------------------|
| BCL-2 | <0.0100 |
| BCL- X_L | 48 |
| MCL-1 | >444 |
| BCL-W | 245 |

EC₅₀, half-maximal effective concentration; K_i , inhibition constant;
TR-FRET, time-resolved fluorescence energy transfer.

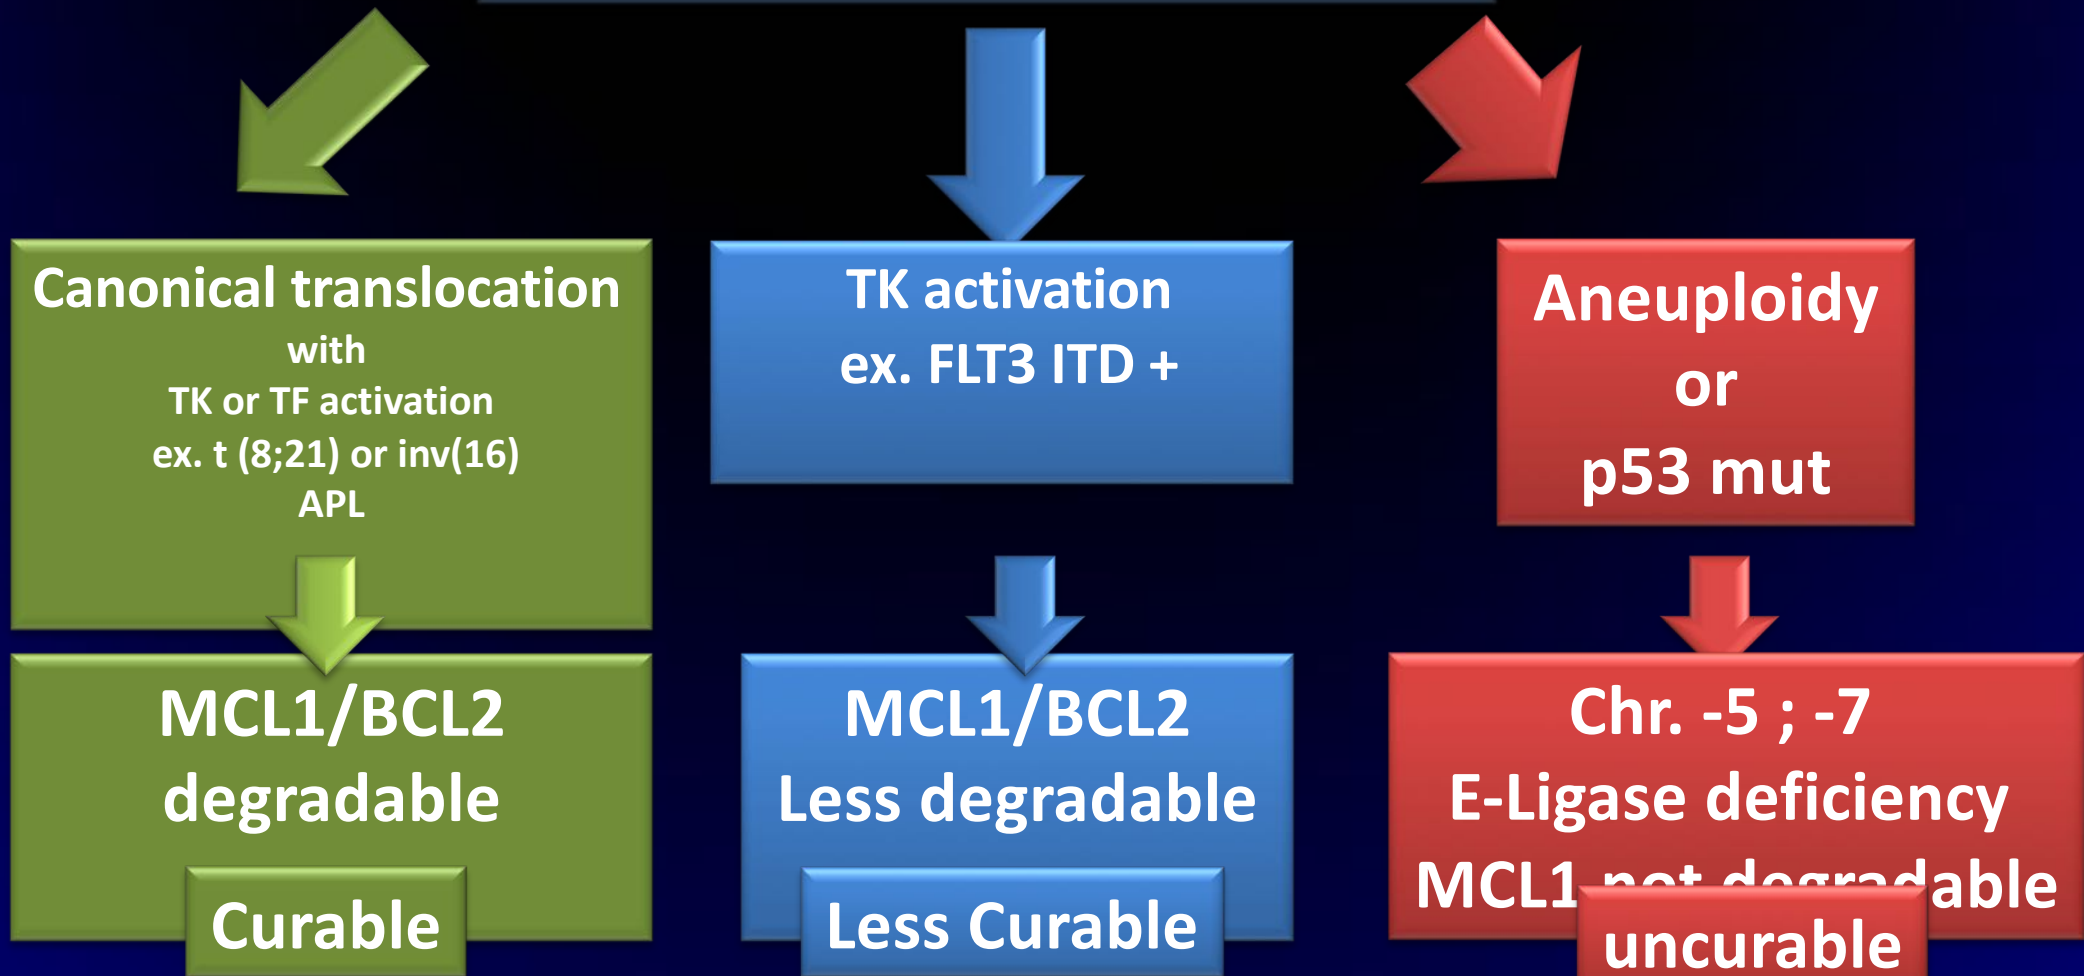

Souers AJ, et al. *Nat Med* 2013; **19**:202–208 (incl. suppl.).

Venetoclax Induces Apoptosis in Malignant Cells

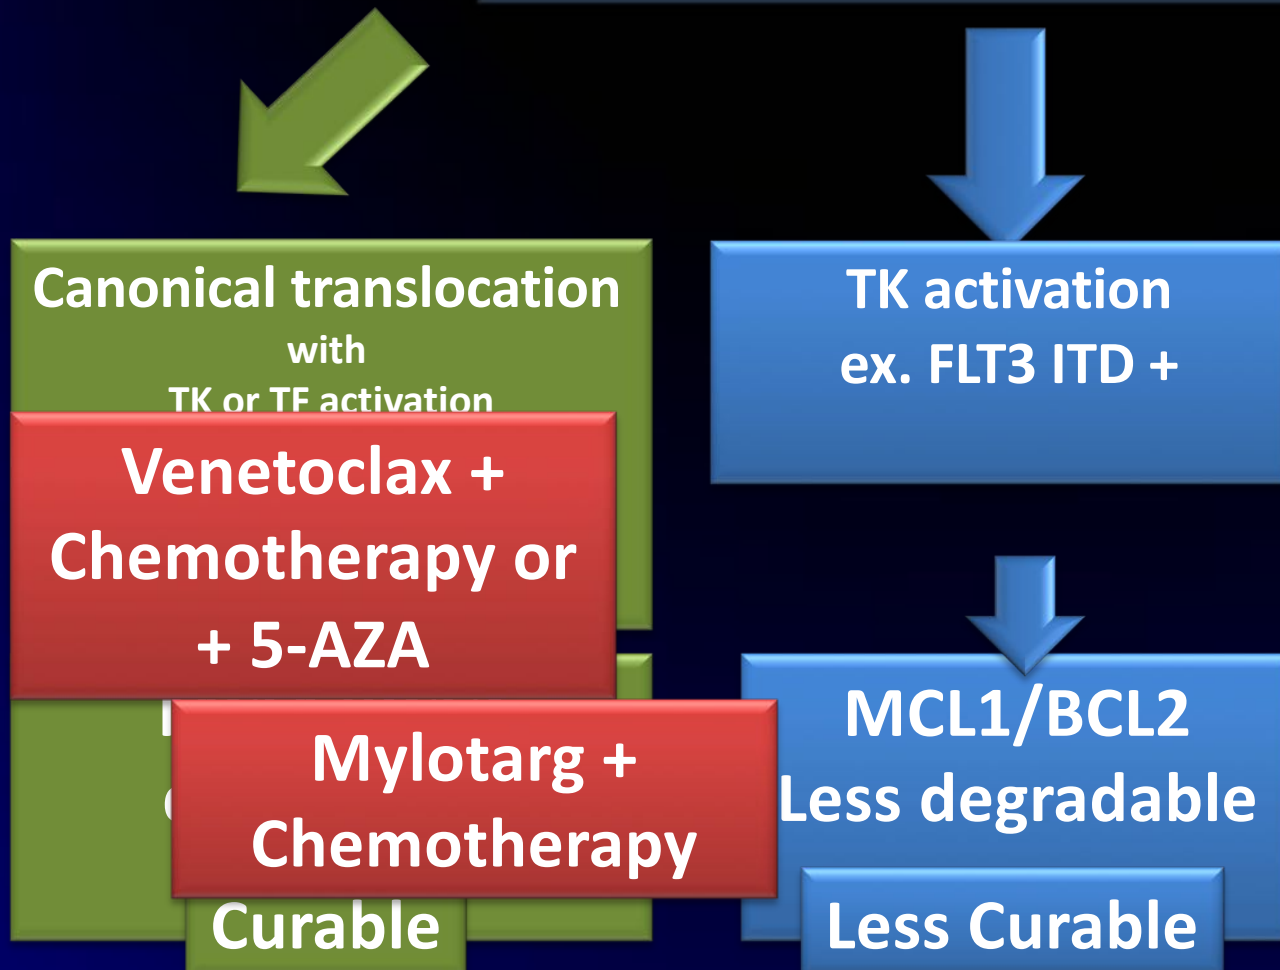

1. Letai A, et al. *Cancer Cell* 2002; **2**:183–192; 2. Adams JM & Cory S. *Oncogene* 2007; **26**:1324–1337; 3. Souers AJ, et al. *Nat Med* 2013; **19**:202–208; 4. Levenson JD, et al. *Cancer Discov* 2017; **7**:1376–1393.

Frontline Venetoclax + HMAs in Elderly AML Pts

- Open-label, nonrandomized, 2-arm, 2-stage, phase Ib study of BCL-2 inhibitor venetoclax

Pats with untreated AML, 65 yrs of age or older, adverse or intermediate-risk cytogenetics, ineligible for standard induction therapy (N = 34)

*In each arm, 1 cohort received venetoclax 400 mg PO and 2 cohorts received 800 mg PO d 2-28 (cycle 1) and d 1-28 (following cycles) of 28-day cycle.

Overall Survival by Response

ITALIAN OBSERVATIONAL STUDY OF PATIENTS WITH ACUTE MYELOID LEUKEMIA TREATED WITH SMALL MOLECULE INHIBITING BCL-2

PI – G. Martinelli/ E. Todisco/N. Fracchiolla

Disegno: Studio multicentrico osservazionale retrospettivo

Obiettivo: valutazione tossicità/efficacia trattamento con **Venetoclax** pazienti con AML

Sample size: 70 Pts, ~ 35 centri

Study duration: 2 yrs

Inclusion criteria:

- LAM Patients who received any anti-BCL2 immunoconjugate from 1 Jan 2015 to 1 Jan 2019 outside clinical
- Informed consent

Take home messages

- **Venetoclax in combination with HMA results in a significant rate of CR even in high risk patients and TP53 mutated**
- Ven+ Comimetinib phase 1 completed and successful
- Ven + Idasanutlin completed and successful
- Ven + Gilteritinib completed and successful
- **Ven + IMG CD123 + AZA ongoing**
- Venetoclax demonstrated activity in R/R AML
- For patients relapsed after HMA the results are still poor
- There are new combinations on the horizon (venetoclax and FLT3 inhibitors)

Why venetoclax works ?

LSC dependency from AA metabolism and G6PD activity

Potentiating apoptosis in ALL and AML

Why 4-HNE accumulate in CD34+ AML ?

To remove 4-HNE glutathione is depleted

Enzymatic production of 4-HNE and metabolism

GS-4HNE is a potent inhibitor of the activity of glutathione S-transferase and produces Thiol Depletion

Thiol depletion produces a structural modification of cysteine

Translocations

1. Helicases are frequently affected in CK AML

CTD1 +/- and Helicases (RecQ +/-) studies suggest that by **homologous recombination (HR)** they catalyze dissolution of **double Holliday junctions**.

Like other RecQ helicases, **RECQ5b** promotes branch migration of **Holliday junctions** and exhibits strand-annealing and strand-exchange activities in vitro.
