Inibitori specifici ed aspecifici della coagulazione

INIBITORI IDIOPATICI

Antonio Coppola

Centro di Riferimento Regionale per le Emocoagulopatie

AOU Federico II, Napoli

un venerdì pomeriggio al Centro Emostasi…

‘ Rianimazione, vorremmo veniste per un uomo di 68 anni che abbiamo dovuto intubare in Maxillo…
… in poche ore si è fatto un ematoma della lingua e del retrofaringe spaventoso… stamattina ha praticato una biopsia di una lesione dietro il pilastro tonsillare, pare sia un linfoma…

… i parenti dicono che ha avuto tanti interventi, ma mai nessun problema… ‘

o ancora bussano in Ambulatorio…

‘ scusa, quando hai un attimo vorrei parlarti di un vecchietto che seguiamo in Cardiologia, ha messo due stents coronarici un anno fa, da qualche tempo fa delle grosse ecchimosi…

… era in doppia antiaggregazione. Abbiamo tolto il clopidogrel…

…e invece di andare meglio, si è presentato stamattina con un ematoma
gli prende tutto l’arto inferiore dx ’

Cosa hanno in comune questi casi ?

- Manifestazioni emorragiche, talora gravi, ad insorgenza recente, improvvisa, spontanee o post-traumatiche
- assenza di storia familiare e personale di emorragia

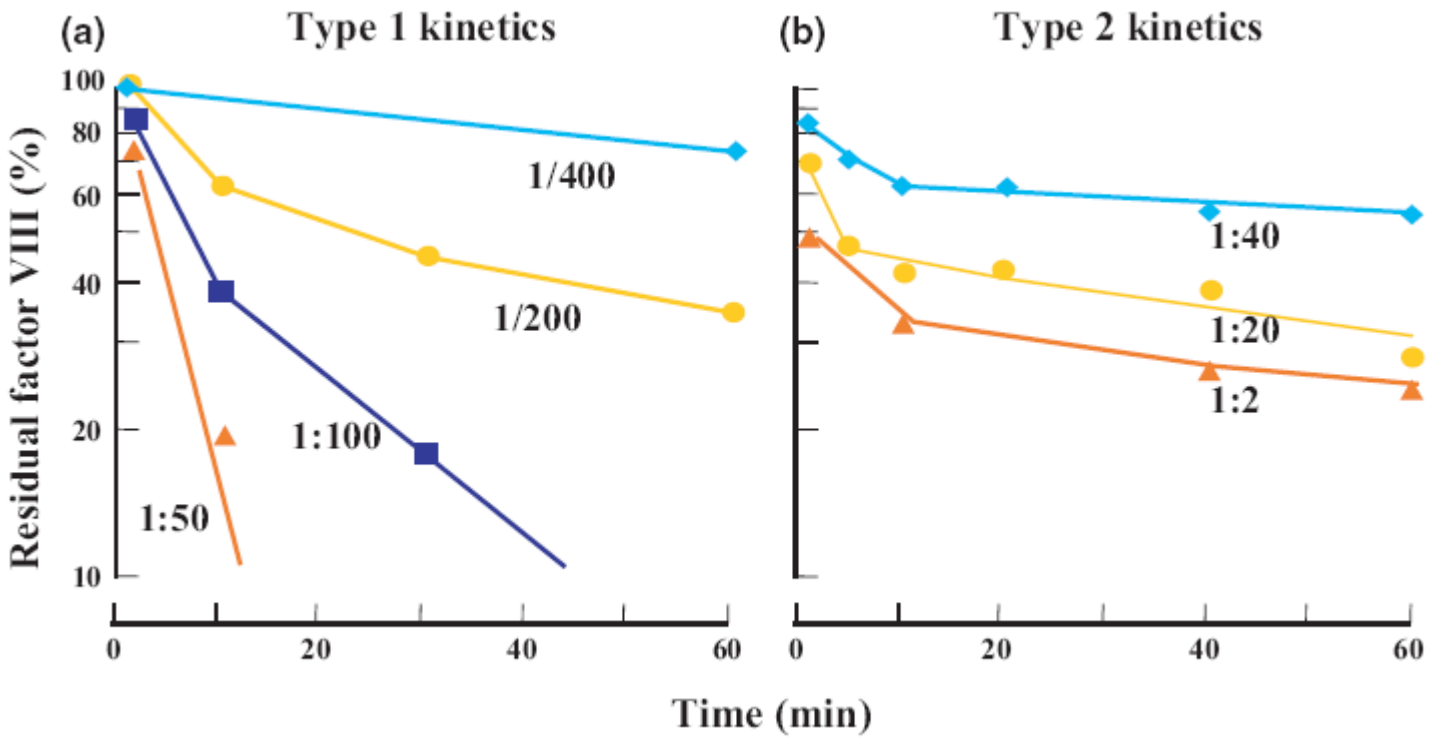
e agli esami di laboratorio

- **Allungamento di APTT**

Emofilia acquisita

Acquired hemophilia

- Rare bleeding disorder (**~ 1.5 in 1x10^6 year**) occurring in subjects with negative personal and family history of bleeding.
- caused
  partiall
  and/or
  coagul



Acquired hemophilia

- Rare bleeding disorder (**~ 1.5 in 1x10^6 year**) occurring in subjects with negative personal and family history of bleeding.
- caused by **circulating auto-antibodies**, that partially or completely neutralize function and/or accelerate clearance of a specific coagulation factor (inhibitors).
- Factor VIII (FVIII) inhibitors are the most commonly reported autoantibodies, therefore AH is in the majority of cases an acquired Factor VIII deficiency (**acquired hemophilia A, AHA**).

Acquired coagulation inhibitors

Autoantibody Against	Characteristic	Associated Conditions
FI	IgG, IgA, IgM	Idiopathic, pregnancy, autoimmune disorders, interferon therapy
FII	IgG	Idiopathic, bovine thrombin, autoimmune disorders (SLE, RA)
FV	IgG	Bovine thrombin, surgery, antibiotic therapy (β-lactam group), malignancies
FVII	IgG	Idiopathic, malignancies, autoimmune disorders
FIX	IgG_4	Idiopathic, autoimmune disorders, postpartum
FX	IgG	Idiopathic, malignancies, autoimmune disorders, antibiotic
FXI	IgG	Malignancies, autoimmune disorders (SLE)
FXIII	IgG directed against A or B FXIII subunits	MGUS, autoimmune disorders (RA, SLE), drugs (isoniazid, penicillin, phenytoin, and amiodarone)

International recommendations on the diagnosis and treatment of patients with acquired hemophilia A

Angela Huth-Kühne,[1] Francesco Baudo,[2] Peter Collins,[3] Jørgen Ingerslev,[4] Craig M. Kessler,[5] Hervé Lévesque,[6] Maria Eva Mingot Castellano,[7] Midori Shima,[8] and Jean St-Louis[9]

ABSTRACT

Acquired hemophilia A (AHA) is a rare bleeding disorder characterized by autoantibodies directed against circulating coagulation factor (F) VIII. Typically, patients with no prior history of a bleeding disorder present with spontaneous bleeding and an isolated prolonged aPTT. AHA may, however, present without any bleeding symptoms, therefore an isolated prolonged aPTT should always be investigated further irrespective of the clinical findings. Control of acute bleeding is the first priority, and we recommend first-line therapy with bypassing agents such as recombinant activated FVII or activated prothrombin complex concentrate. Once the diagnosis has been achieved, immediate autoantibody eradication to reduce subsequent bleeding risk should be performed. We recommend initial treatment with corticosteroids or combination therapy with corticosteroids and cyclophosphamide and suggest second-line therapy with rituximab if first-line therapy fails or is contraindicated. In contrast to congenital hemophilia, no comparative studies exist to support treatment recommendations for patients with AHA, therefore treatment guidance must rely on the expertise and clinical experience of specialists in the field. The aim of this document is to provide a set of international practice guidelines based on our collective clinical experience in treating patients with AHA and contribute to improved care for this patient group.

Haematologica 2009; 94:566-575

Raccomandazioni per il trattamento delle emorragie

Sintesi della raccomandazione	Grado
'Wait and watch' nei pazienti senza manifestazioni emorragiche di rileivo	2C
Rimozione ove possibile della verosimile condizione scatenante approccio prioritario	2C
Acido tranexamico per emorragie mucose non gravi	2B
Agenti bypassanti trattamento di prima linea in pazienti con emofilia A acquisita ed emorragie clinicamente significative	1B
FVIII e DDAVP da riservare in paziento con FVIII misurabile e bassi titoli anticorpali. Monitoraggio assiduo livelli FVIII raggiunti e risposta anamnestica	2C
Switch precoce ad agente bypassante alternativo in caso di insuccesso	2C
Plasmaferesi e immunoadsorbimento da considerare in pazienti con emorragie gravi, non responsive ai bypassanti o per procedure invasive urgenti	2B

Diagnosi e trattamento degli inibitori acquisiti dei fattori della coagulazione. Raccomandazioni AICE 2014

[Intervention Review]

Interventions for treating acute bleeding episodes in people with acquired hemophilia A

Yan Zeng[1a], Ruiqing Zhou[2], Xin Duan[3], Dan Long[4], Songtao Yang[5]

Authors' conclusions

No randomised clinical trials of hemostatic therapies for acquired hemophilia A were found. Thus, we are not able to draw any conclusions or make any recommendations on the optimal hemostatic therapies for acquired hemophilia A based on the highest quality of evidence. GIven that carrying out randomized controlled trials in this field is a complex task, the authors suggest that, while planning randomised controlled trials in which patients can be enrolled, clinicians treating the disease continue to base their choices on alternative, lower quality sources of evidence, which hopefully, in the future, will also be appraised and incorporated in a Cochrane Review.

Editorial group: Cochrane Cystic Fibrosis and Genetic Disorders Group.

56%

The outcome of first-line immunosuppressive therapy (IS) is shown. Complete remission (CR) was defined as inhibitor-negative, FVIII > 70 IU/dL, and immunosuppressive therapy stopped. Stable CR was defined as achieving CR with no relapse during follow-up. Because the groups are not matched, it is not appropriate to make statistical comparisons between the treatment arms.
