RADIOTERAPIA ONCOLOGICA TREVISO

Disclosure

The randomized phase II part of the study was sponsored by Sanofi- Aventis, Italy.

I have no conflicts of interest to disclose .

Società Italiana di Radiobiologia
MATERIALE NON RIPRODUCIBILE

Background

- The efficacy of induction CT in prolonging OS when added to locoregional treatment has not been proven .
- TPF is superior to induction PF in OS¹.
- CRT w/wo induction CT has been recently investigated in three phase III trials:
 - two trials were prematurely terminated to slow accrual^{2,3}
 - one trial was negative⁴

F (800 mg/m² 96h CI)
Q 3 weeks x 3 cycles

no induction

Conventional RT
70 Gy in 2.0 Gy fr /7w

1° : radiological CR at end of treatment

Neck dissection in N2-3 pts with pCR
on primary site at the end of CT\RT

*PF: Cisplatin (20 mg/m² d1-4)
5-FU (800 mg/m² 96h CI)

Complete Response: primary endpoint

Paccagnella et al, Annals of Oncology 2010

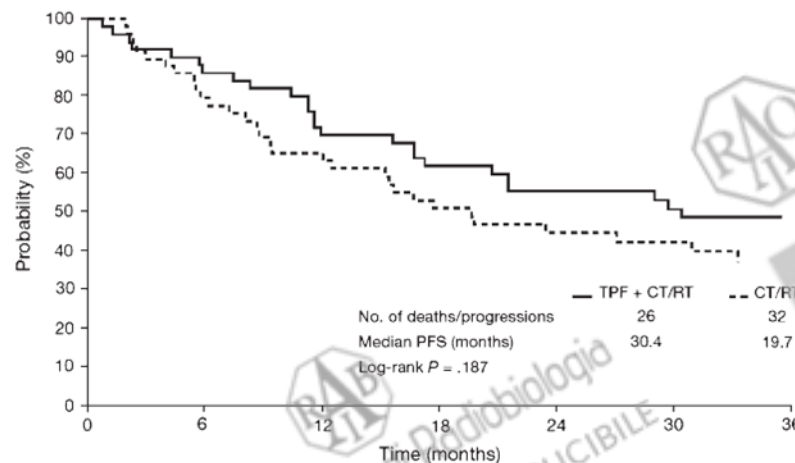

| Response | CT/RT (arm A) (N = 47), n (%) | TPF + CT/RT (arm B) (N = 46), n (%) |
|----------------------------|----------------------------------|--|
| Complete response (95% CI) | 10 (21.3) (10.7% to 35.7%) | 23 (50.0) (34.9% to 65.1%) |
| Partial response | 29 (61.7) | 13 (28.2) |
| Stable disease | 0 | 1 (2.2) |
| Progressive disease | 8 (17.0) | 9 (19.5) |
| Overall response rate | 39 (83.0) | 36 (78.2) |

Three cycles of induction TPF is a feasible treatment and does not compromise the delivery of subsequent CRT.

The difference in CR in favor of TPF induction CT ($p=0.004$) justifies the starting of the Phase III part of the study.

Abstract

Background: The aim of this study was to evaluate the efficacy and toxicity of concomitant docetaxel and radiotherapy in head and neck squamous cell carcinoma.

Methods: A phase III randomized controlled trial was conducted in 100 patients with head and neck squamous cell carcinoma. The study compared the efficacy and toxicity of concomitant docetaxel and radiotherapy (TPF + CT/RT) versus radiotherapy alone (CT/RT).

PHASE II-III STUDY DESIGN

Phase II part of the study

studio H&N07

ABSTRACT

BACKGROUND

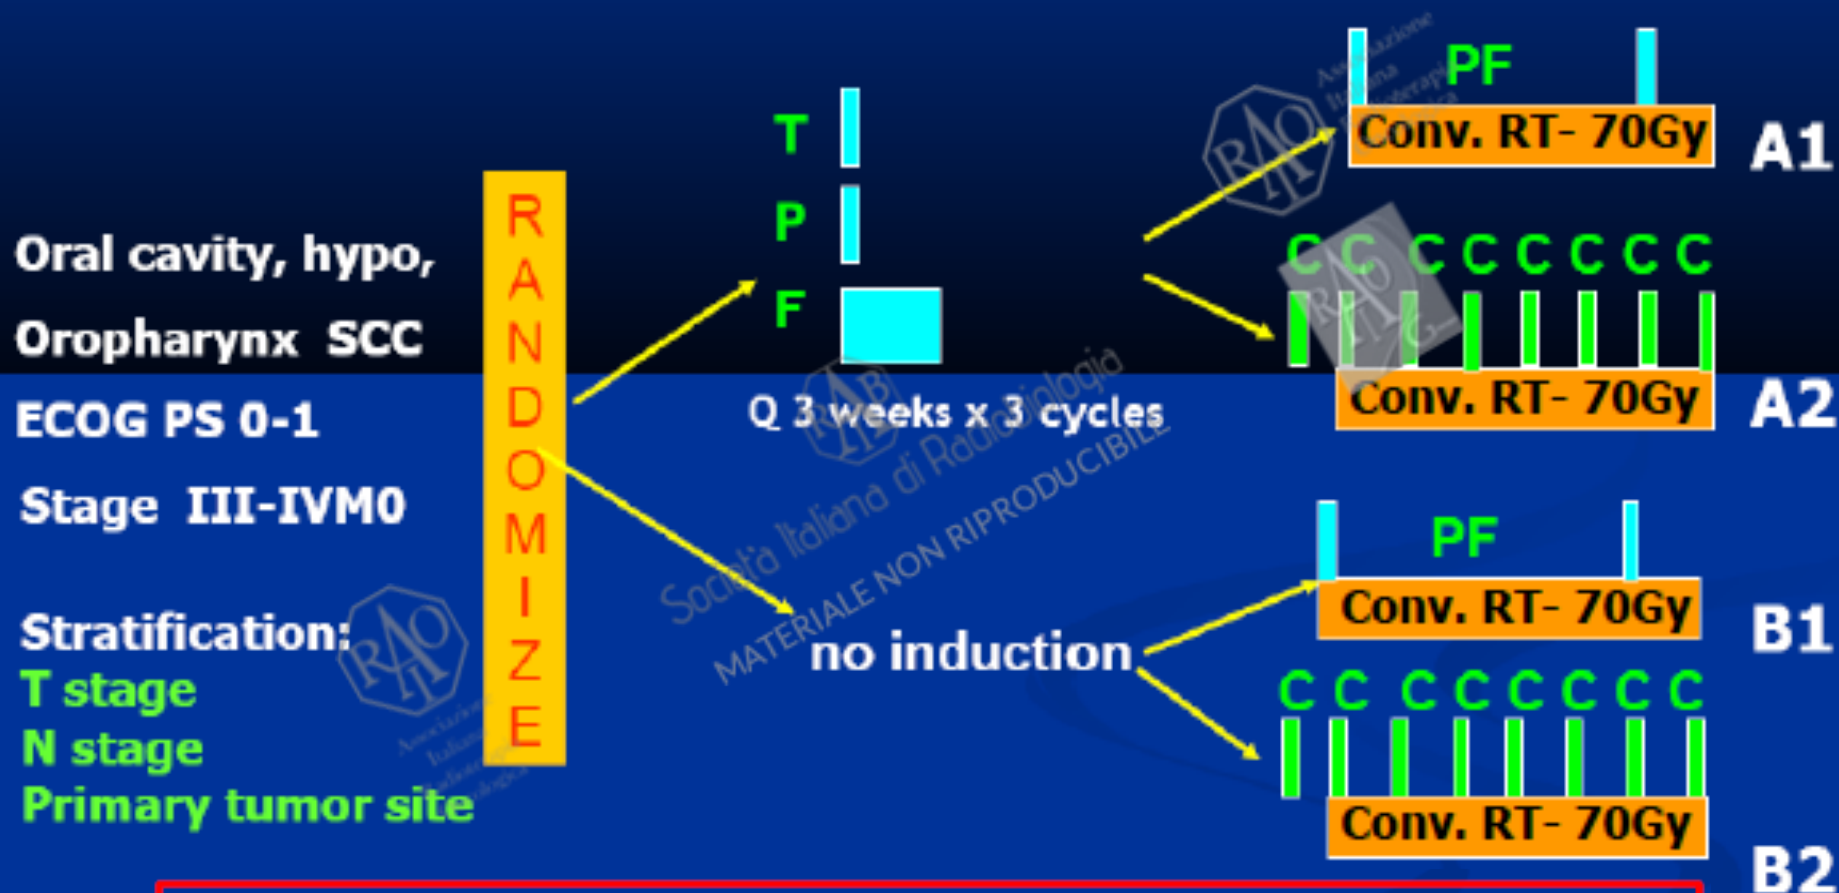

We conducted a multinational, randomized study to compare radiotherapy alone with radiotherapy plus cetuximab, a monoclonal antibody against the epidermal growth factor receptor, in the treatment of locoregionally advanced squamous-cell carcinoma of the head and neck.

PHASE II-III STUDY DESIGN

Phase III part of the study

- For the phase III part of the study, the cetuximab/RT treatment option was added in both arms in a 2x2 factorial design .
- The cetuximab/RT arms were numerically not balanced by design.

PHASE III PART: 2 X 2 FACTORIAL DESIGN

Primary endpoints:

- 1) 3y OS Induction vs no induction: A1+A2 vs B1+B2
- 2) G3-4 in field toxicity : A1+B1 vs A2+B2

Statistical considerations:

OS endpoint: induction vs no-induction (A1+A2 vs B1+B2)

420 (210 per arm) pts required to detect a difference of 12% in 3 year overall survival in favor of the induction arm (from 52.5% to 64.5%). Power=0.85; HR=0.675; type I error of 0.05, two-sided.

- Accrual 4y + 2y follow-up

Toxicity endpoint: CRT vs cetuximab/RT (A1+B1 vs A2+B2)

A number of 420 patients will provide a power of 80% to detect a difference of 10% (from 45% to 35%) in grade 3-4 in-field toxicity in favor of RT/Cetuximab arm.

- Cetuximab arm numerically unbalanced by design

Statistical considerations:

**OS endpoint: induction vs no-induction
(A1+A2 vs B1+B2)**

420 (210 per arm) pts required to detect a difference of 12% in 3 year overall survival in favor of the induction arm (from 52.5% to 64.5%). Power=0.85; HR=0.675; type I error of 0.05, two-sided.

- Accrual 4y + 2y follow-up

**Toxicity endpoint: CRT vs cetuximab/RT
(A1+B1 vs A2+B2)**

A number of 420 patients will provide a power of 80% to detect a difference of 10% (from 45% to 35%) in grade 3-4 in-field toxicity in favor of RT/Cetuximab arm.

Main inclusion criteria

- SCC of the oral cavity, oroph, hypopharynx (no larynx)
- Stage III or IV—M0 (AJCC 6th edition) unresectable
- At least one measurable lesion
- Age ≥ 18 years
- ECOG PS: 0—1
- Life expectancy >6 months
- Adequate haematological, hepatic and renal function
- Written informed consent

Treatments

Induction TPF*:

- docetaxel 75 mg/sqm d 1
- cisplatin 80 mg/sqm d1
- 5Fluorouracil 800 mg/sqm/d 96h c.i.

Antibiotics starting on day 5 for 10 days

CRT*:

- RT 70 Gy (2 Gy/day, 5 d per week for 7 wks)
- CT cisplatin 20 mg/sqm d 1-4
5-Fluorouracil 800mg/sqm/d 96h c.i.
on weeks 1 and 6

cetuximab/RT:

- RT 70 Gy (2 Gy/day, 5 d per week for 7 wks)
- Cetuximab 400 mg/sqm d -7, 250 mg/sqm w x 7 wks

PFS by concomitant treatment (Intention To Treat analyses)

OS by concomitant treatment (Intention To Treat analyses)

CONCLUSIONS

- TPF followed by concomitant treatments is superior to concomitant treatments alone in CR, PFS and OS (primary endpoint) with a significant reduction in locoregional failure.

This has to be intended as a proof of principle.

- The beneficial effect of induction TPF may weight differently according to the **primary tumor site** and to the subsequent **concomitant strategy**.

- Since this is a 2x2 factorial study with 2 different concomitant treatments and 2 different experimental arms, these phase III results are difficult to transpose into clinical practice.
