'No conflict of interest'

Would MF/SS fit the model for a prognostic index?

- Wide range of survival within stages[1]
  - **IB;** 5yr DSS 89%, 10yr 77%
  - **IIB;** 5yr OS 47%, 20yr 21%
  - **IIIA;** 5yr OS 47%, 20yr 25%
  - **IVA$_2$;** 5yr OS 18%, 20yr 3%

IB

IIIA

- Variety of poor prognostic variables identified in previous studies [2,3]
- No treatment shown improve survival, no cure with the exception BMT is select patients
- Treatment is frequently decided on an individual patient basis dependent on the presence of poor prognostics factors in addition to the staging & management varies between centres

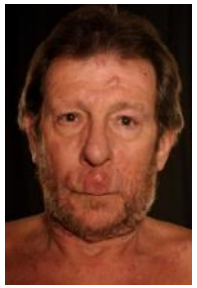
[1]Agar NS et al *J Clin Onc*. 2010;28(31):4730-9, [2]Benton E et al *Eur J Cancer*. 2013;49(13);2859-68, [3]Scarisbrick J er al *J Clin Onc* 2015;33(32):3766-73

Poor Prognostic Markers within Stage[1]

Clinical Markers

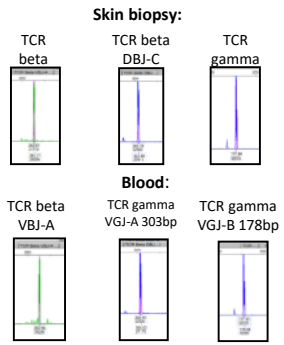
- Age of diagnosis > 60yrs
- Male Sex? Not conclusive, varies between centres

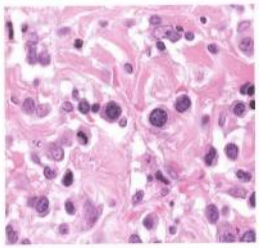
- **Pathological Skin Markers**
  - Folliculotropism
  - CD30 positivity in skin? Not conclusive, varies between centres
  - Large cell transformation (skin)
  - High cell proliferation index (Ki-67, MIB-1) in skin
- **Haematological Markers**
  - Raised lymphocyte count
  - Raised serum LDH
  - Identical clone blood and skin defined by PCR



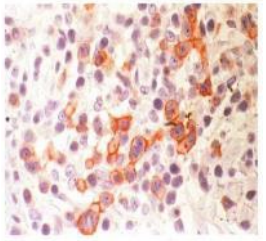
Folliculotropic tumours

Folliculotropic plaques





Large cell transformation



CD30 positivity

[1]Scarisbrick J et al. Prognostic Factors, Prognostic Indices and Staging in Mycosis Fungoides and Sézary Syndrome: Where are we now? Br J Dermatol. 2014;170(6):1226-36.

Good Prognostic Markers[1]

Clinical Markers

- Age of diagnosis <60yrs
- Duration MF > 10 years
- Patches without plaques
- Poikiloderma
- Hypopigmented variant
- Associated lymphomatoid papulosis

Pathological Markers

- CD8+ variant (hypopigmented, younger age)

Hypopigmented MF

Poikilodermatous MF

Lymphomatoid papulosis lesions

[1]Scarisbrick J et al. Prognostic Factors, Prognostic Indices and Staging in Mycosis Fungoides and Sézary Syndrome: Where are we now? Br J Dermatol. 2014;170(6):1226-36.

Proposed Indices in Cutaneous Lymphoma

- Prognostic Index, MD Anderson, 1999[1]

  tumours, age >60, LDH

- CTCL-Severity Index (SI), 2005[2]

  blood, lymph node involvement

- Cutaneous Lymphoma International Prognostic Index, London, 2013[3]

  male, age ≥ 60, $N_{2/3}$, $B_{1/2}$, M_1

- CLIC Retrospective Model, 29 sites, 2015[4]

  age>60, LDH, large cell transformation skin, stage IV

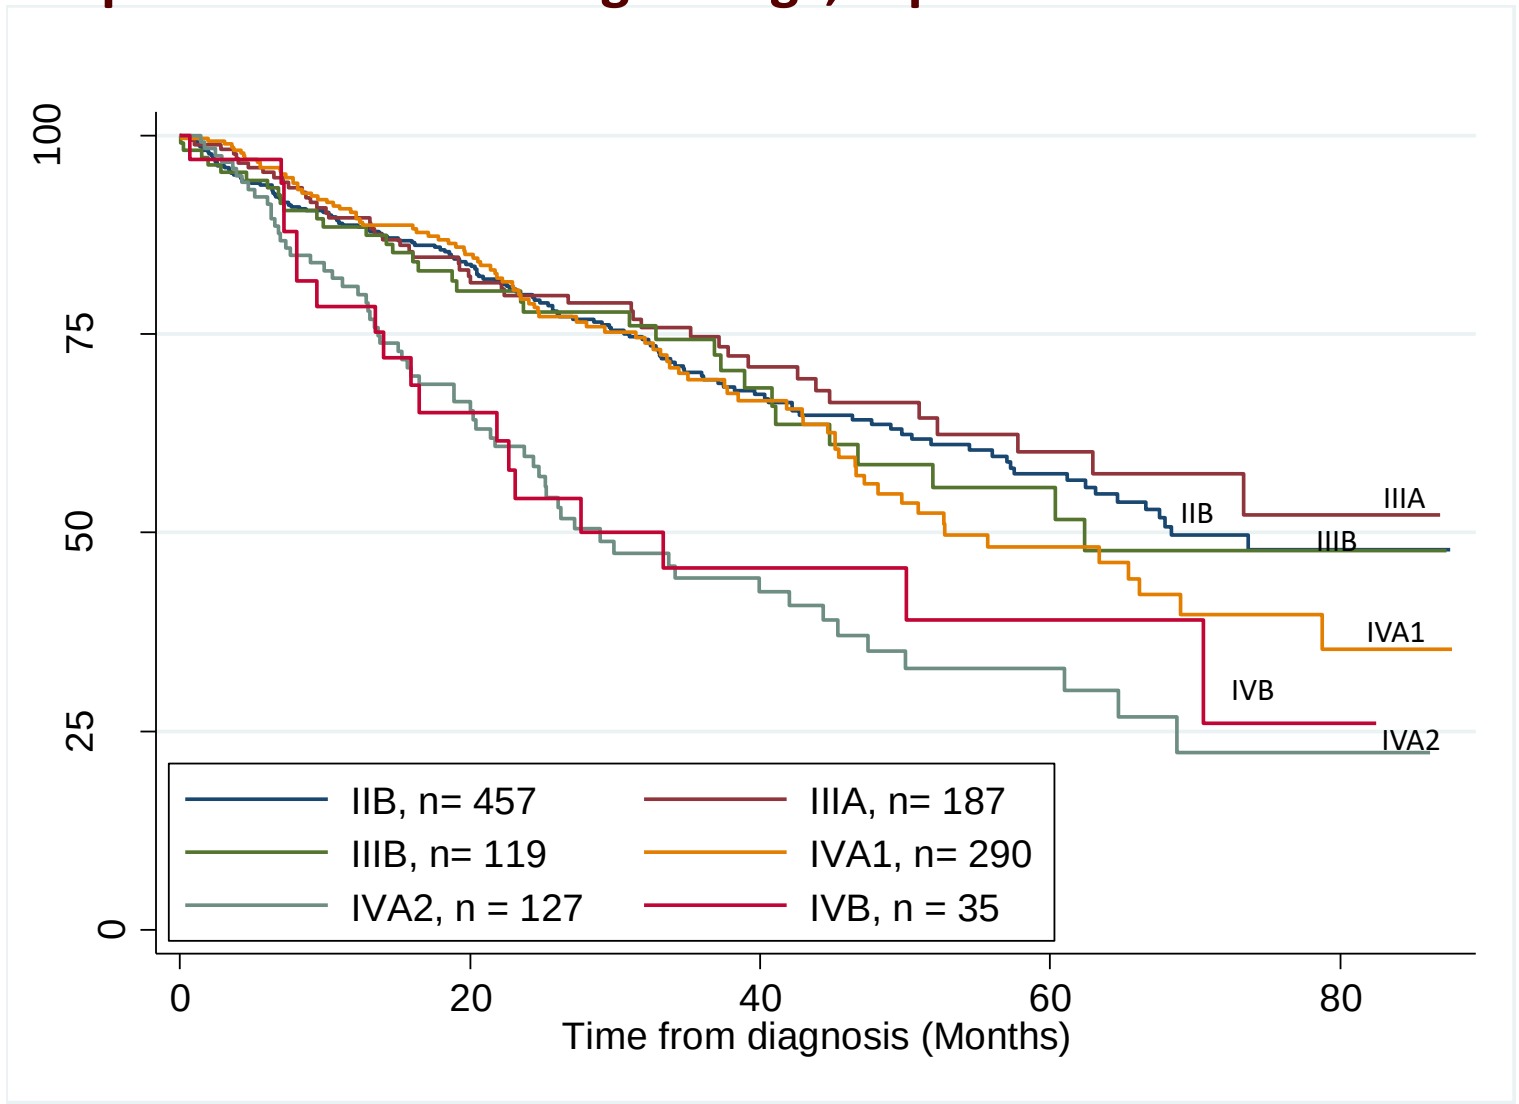
CLIC
CUTANEOUS LYMPHOMA INTERNATIONAL CONSORTIUM

29 International Sites, 5 continents
Participated recruited 1275 advanced stage patients

Disease Specific Survival (DSS) Against Stage

	No. of patients	Mean Age	Deaths	Median Survial	Mean DSS mnths	1-year DSS	2-year DSS	5-year DSS
IIB	457	62	132	NR	67	93%	80%	67% (57)
III (all)	320	65	80	NR	66	92%	85%	66% (58)
IIIA	187	63	46	NR	67	92%	84%	68% (60)
IIIB	119	66	33	NR	65	93%	87%	66% (56)
IVA (all)	463	64	168	63	57	92%	80%	52% (43)
IVA1	290	66	87	66	61	93%	85%	56% (48)
IVA2	127	60	61	44	49	87%	69%	44% (33)
IVB	35	65	18	33	44	79%	54%	39% (39)
Stages (all)	1275	63	398	NR	63	92%	83%	61% (52)

Retrospective Data According to Stage; Kaplan Meier Survival



Stage IIB n=457	1	P value
Stage III n=320	0.98 (0.71, 1.35)	0.895
Stage IVA n=463	1.54 (1.08, 2.18)	0.016
Stage IVB n=35	1.80 (1.05, 3.11)	0.034

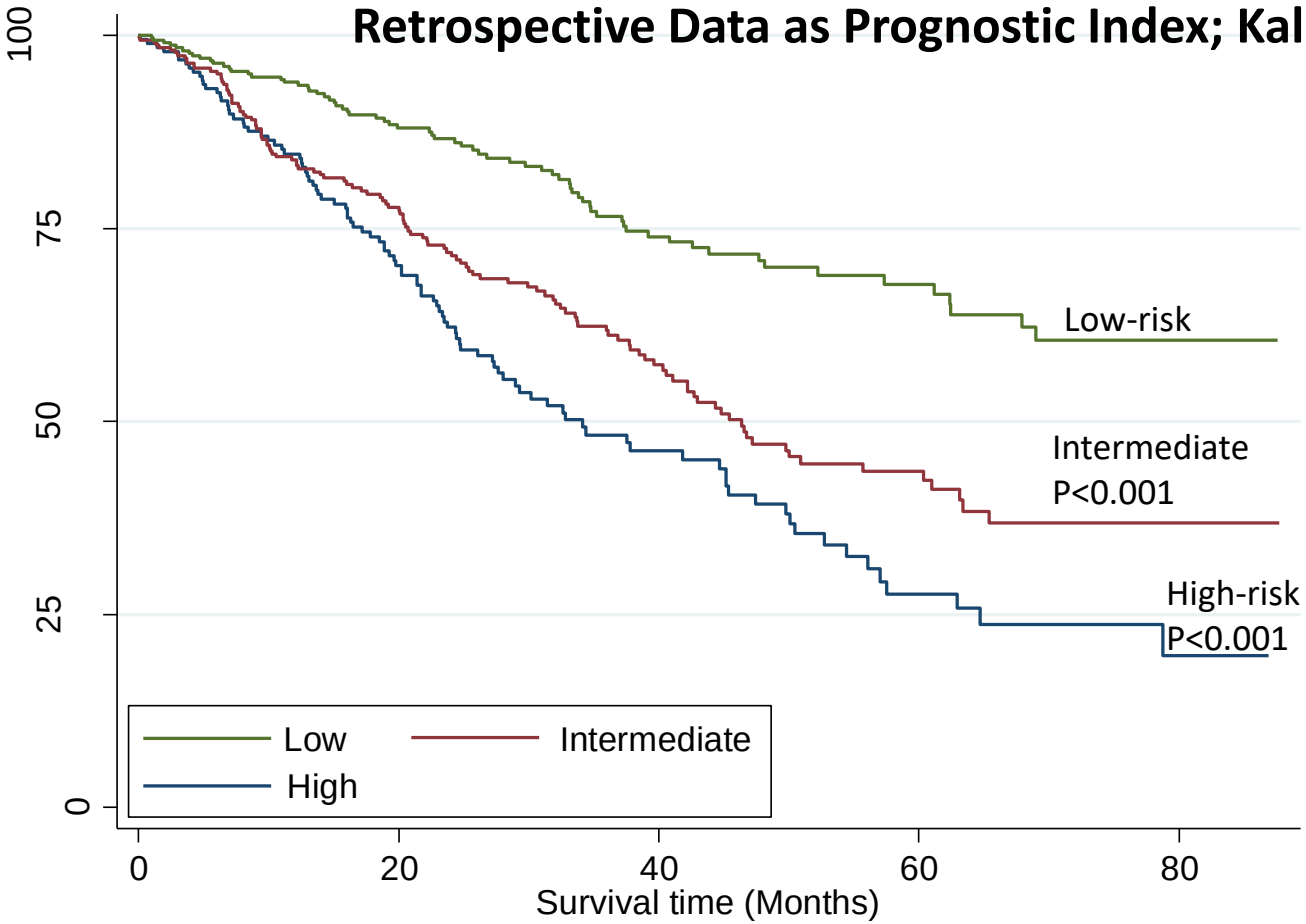
Multivariate Analysis of 1275 advanced MF/SS patients from 29 centres in 13 countries

Variable	Hazard ratio (95% CI)	p-value
Male	1.18 (0.95, 1.47)	0.142
60 +	**1.82 (1.43, 2.33)**	**<0.001**
Identical clone blood to skin Y	1.22 (0.87, 1.70)	0.248
Raised WCC	1.09 (0.80, 1.48)	0.604
Low WCC	0.80 (0.36, 1.75)	0.57
Raised LDH	**1.50 (1.15, 1.94)**	**<0.001**
Raised lymphocyte	0.75 (0.54, 1.04)	0.081
Low lymphocyte	1.20 (0.82, 1.77)	0.35
Stage III	1.17 (0.83, 1.63)	0.372
Stage IV	**1.95 (1.34, 2.86)**	**0.009**
SS (vs MF)	0.73 (0.52, 1.03)	0.073
FT at Dx N	0.61 (0.43, 0.88)	0.07
LCT at Dx Y	**1.64 (1.25, 2.16)**	**<0.001**
CD 30+ve >= 10	1.08 (0.74, 1.58)	0.677
Ki 67 +ve >=20	0.85 (0.55, 1.32)	0.472

Retrospective Data as Prognostic Index

- By combining these 4 factors significant in a prognostic model
  - Stage IV
  - Age
  - Raised LDH
  - LCT in skin
- Divides patients into risk groups for disease progression
  - Low-risk = 0-1 factors
  - Intermediate-risk = 2 factors
  - High-risk = 3-4 factors
- Separated advanced cohort into
  - **Low-risk: n = 327** (IIB n=166, III n=134, IV n=27)
  - **Intermediate-risk: n= 329** (IIB n=91, III n=82, IV n=156)
  - **High-risk: n = 201** (IIB n=20, III n=4, IV n=177)

Retrospective Data as Prognostic Index; Kalpein Meier



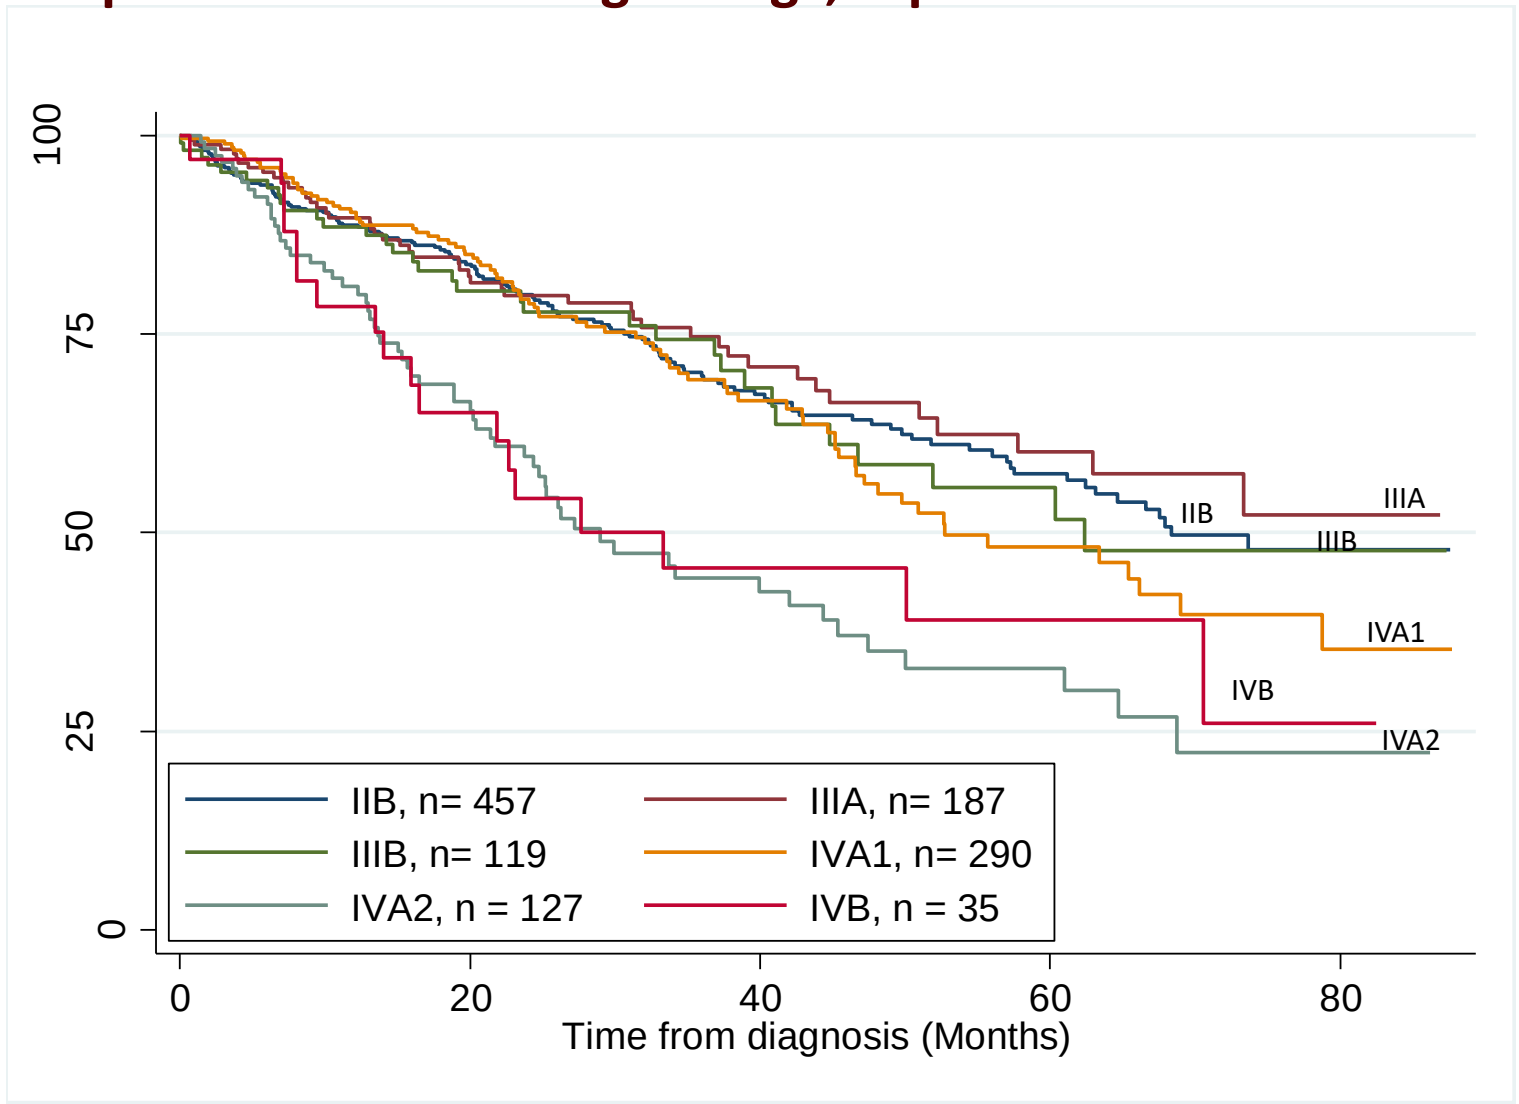
Excluded patients with missing age, stage, LDH and LCT from these analyses n=857 (IIB=277, III=220, IV=360)

4 Variables: age>60, LCT skin, raised LDH, stage IV

Low risk – 0-1 variable
Intermediate risk – 2 variables
High risk - 3-4 variables

Risk of poor survival (No risk factor)	N (deaths)	N IIB	N III	N IV	1-year survival	2-year survival	5-year survival	Median OS months	Hazard ratio (95% CI, p-value)
Low (0-1)	327(100)	166 (60%)	134 (61%)	27 (8%)	94%	87%	68%	NR	1
Intermediate (2)	329 (123)	91 (33%)	82 (37%)	156 (43%)	84%	72%	44%	46	2.09 (1.56, 2.80; p<0.001)
High (3-4)	201(100)	20 (7%)	4 (2%)	177 (49%)	85%	62%	27%	34	2.91 (2.15, 3.96; p<0.001)

Retrospective Data According to Stage; Kaplan Meier Survival



Stage IIB n=457	1	P value
Stage III n=320	0.98 (0.71, 1.35)	0.895
Stage IVA n=463	1.54 (1.08, 2.18)	0.016
Stage IVB n=35	1.80 (1.05, 3.11)	0.034

PROCLIPI

PROCLIPI Study

To test this prognostic index and other prognostic factors internationally and prospectively

PROspective **C**utaneous **L**ymphoma **I**nternational **P**rognostic **I**ndex

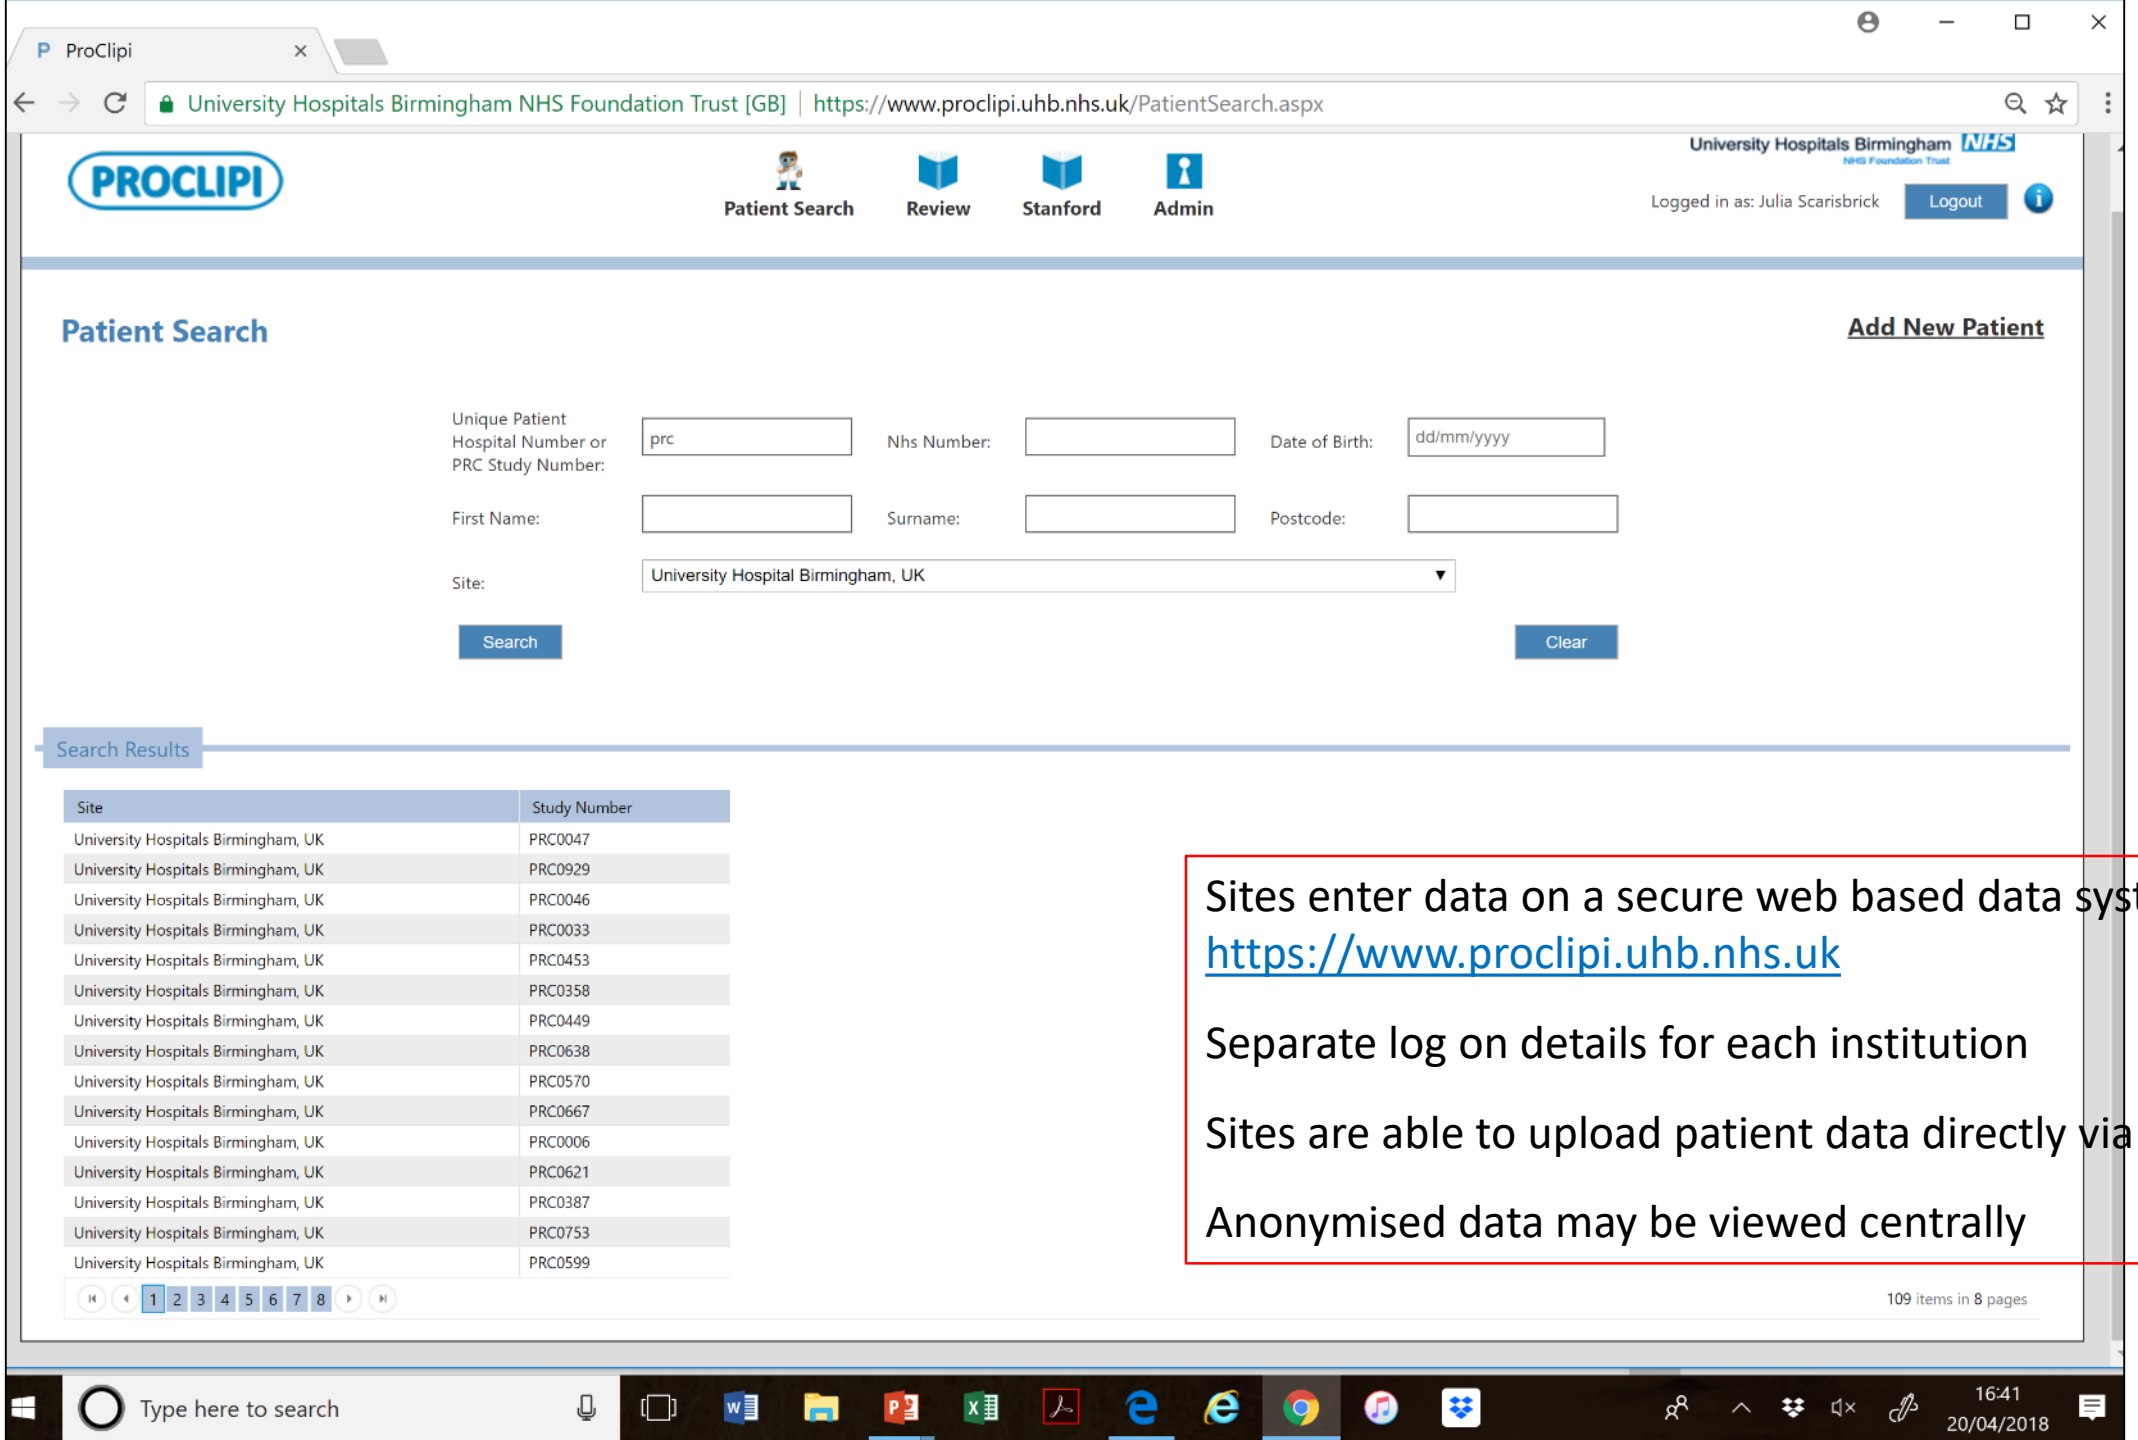
PROspective Cutaneous Lymphoma International Prognostic Index Study; *Opened July 2015*

- The purpose of PROCLIPI is to develop a PI in cutaneous lymphoma by collecting data at diagnosis and measuring against survival
  - Clinical
  - Pathological
  - Nodal
  - Haematological
  - Genotypic
  - Treatment
  - Biobank Material

- Prognostic variables will be tested against overall & progression free survival
- We will recruit a minimum of 1000 patients with early stage MF and 500 with advanced MF/SS over the 5 year study period, survival data for 10+ years
- 20% of patients to be used in the validation set



Sites enter data on a secure web based data system
https://www.proclipi.uhb.nhs.uk

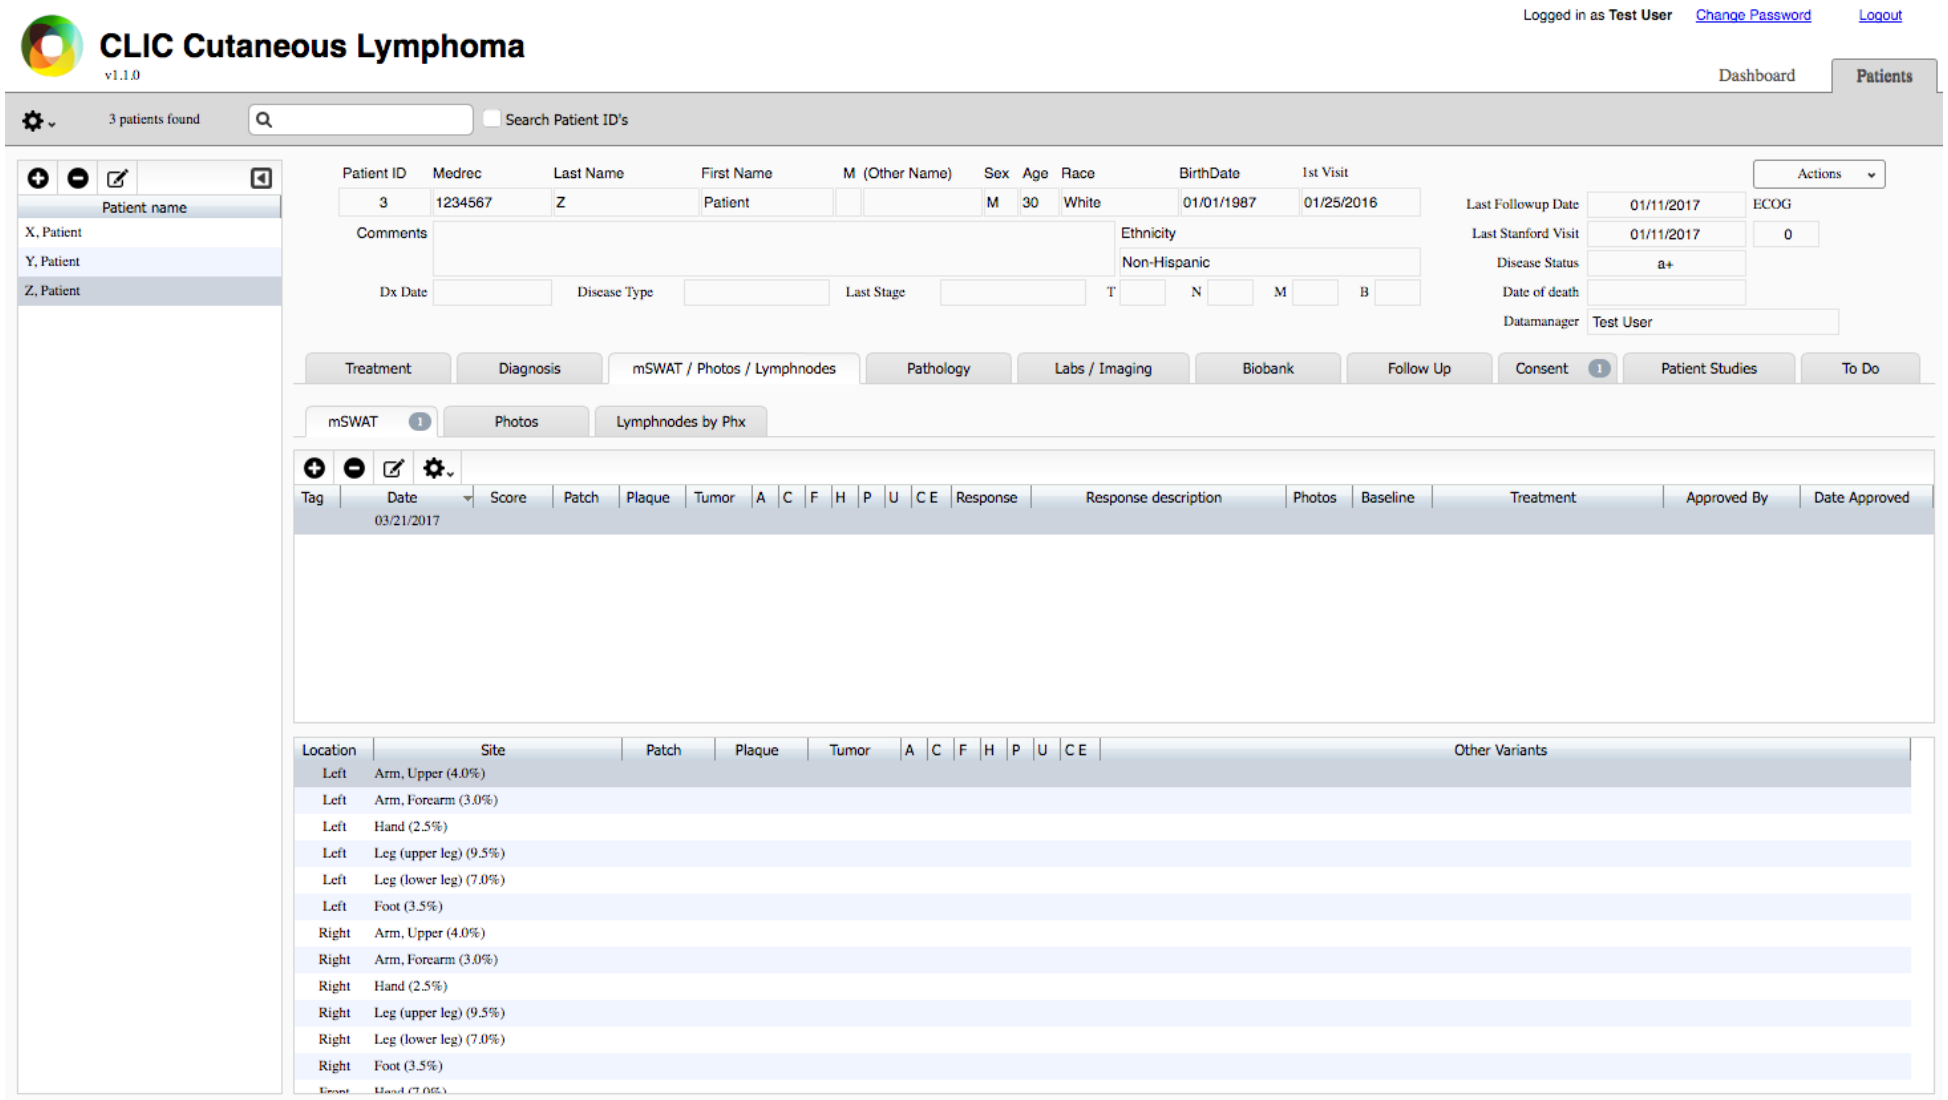
Separate log on details for each institution

Sites are able to upload patient data directly via web

Anonymised data may be viewed centrally

CLIC CL App developed as data language platform, Stanford Program

‘CLIC CL Application’



- Securely installed at local server or computer
- Use as center’s own database

PROCLIPI UHB database & CLIC CL App share a data dictionary & allow data flow between data systems (data share agreements in place)

64 Registered PROCLIPI Centres

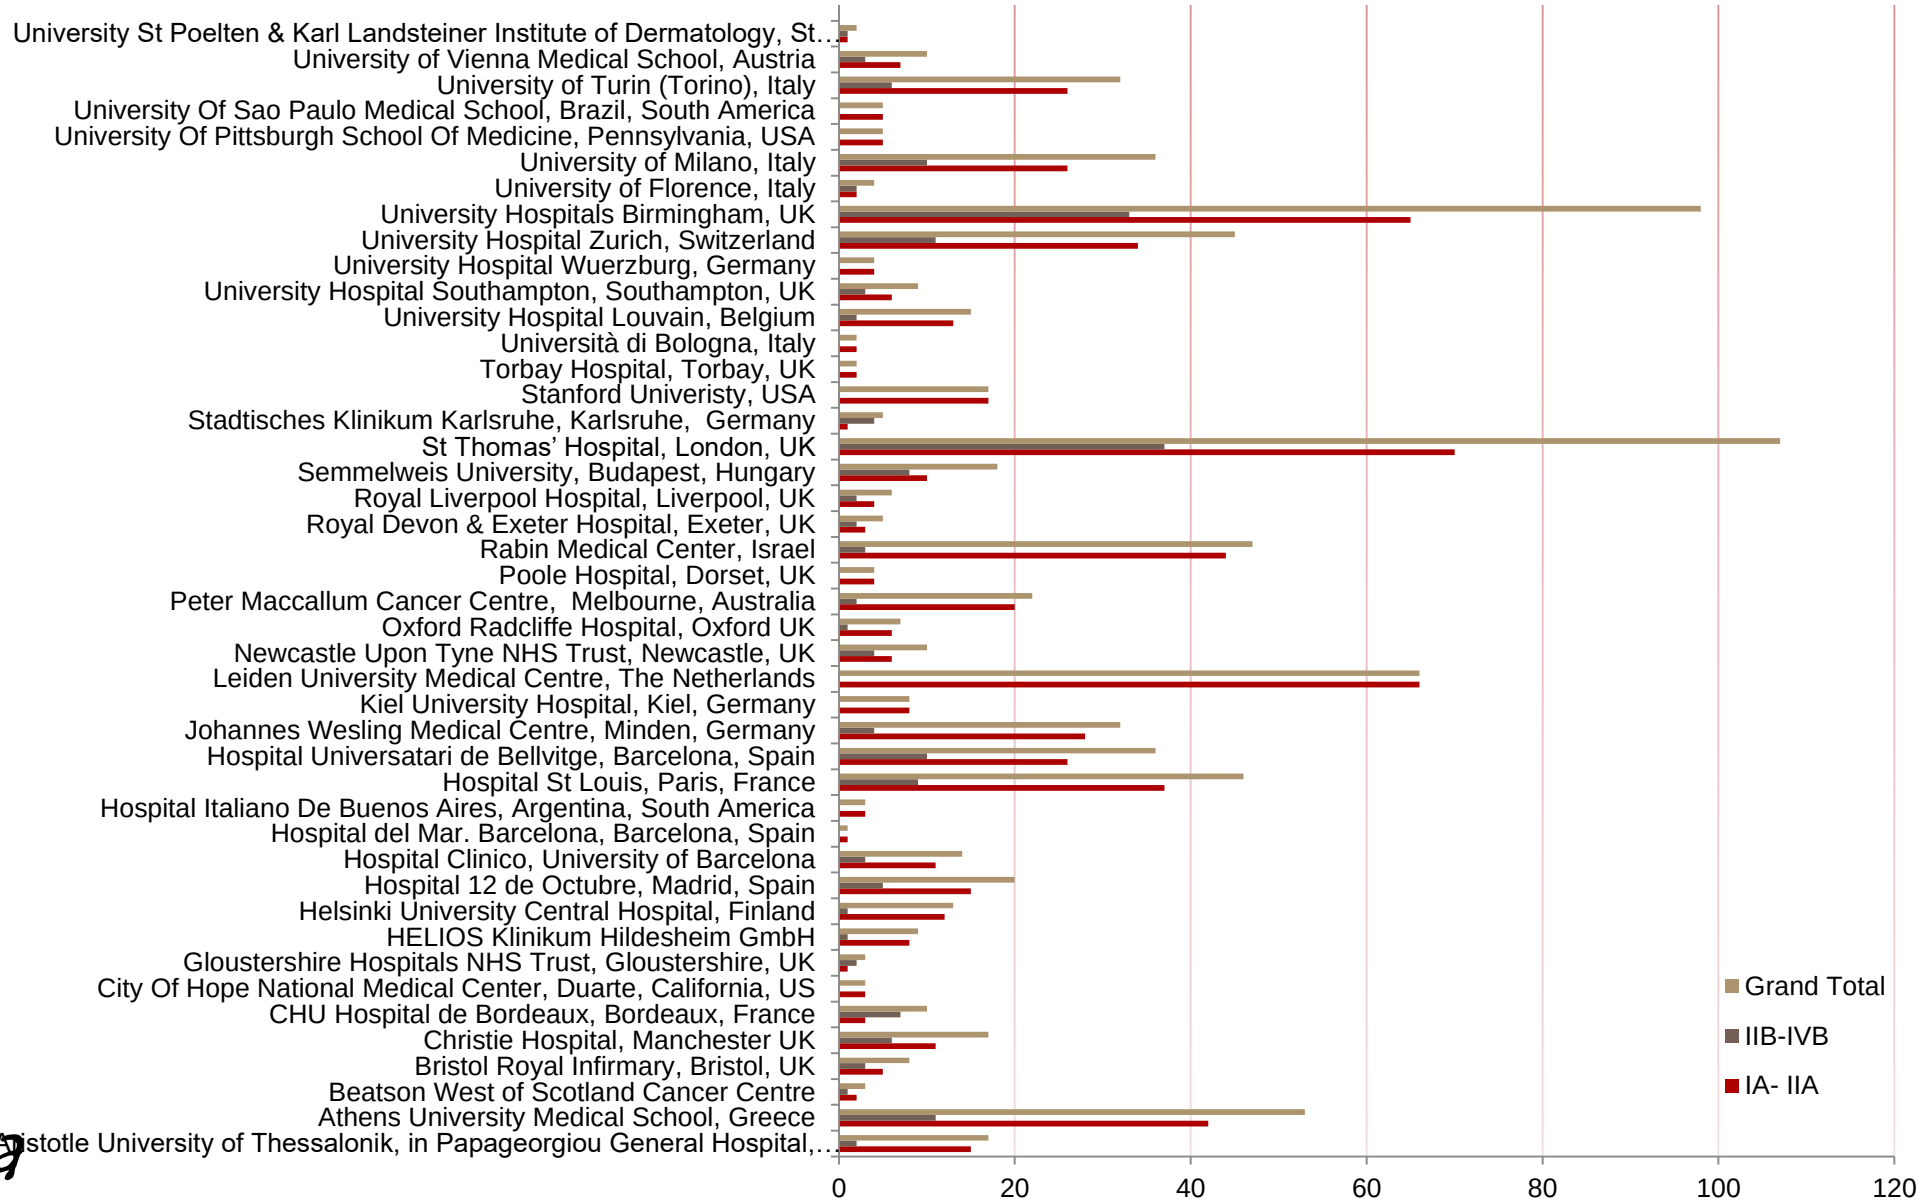
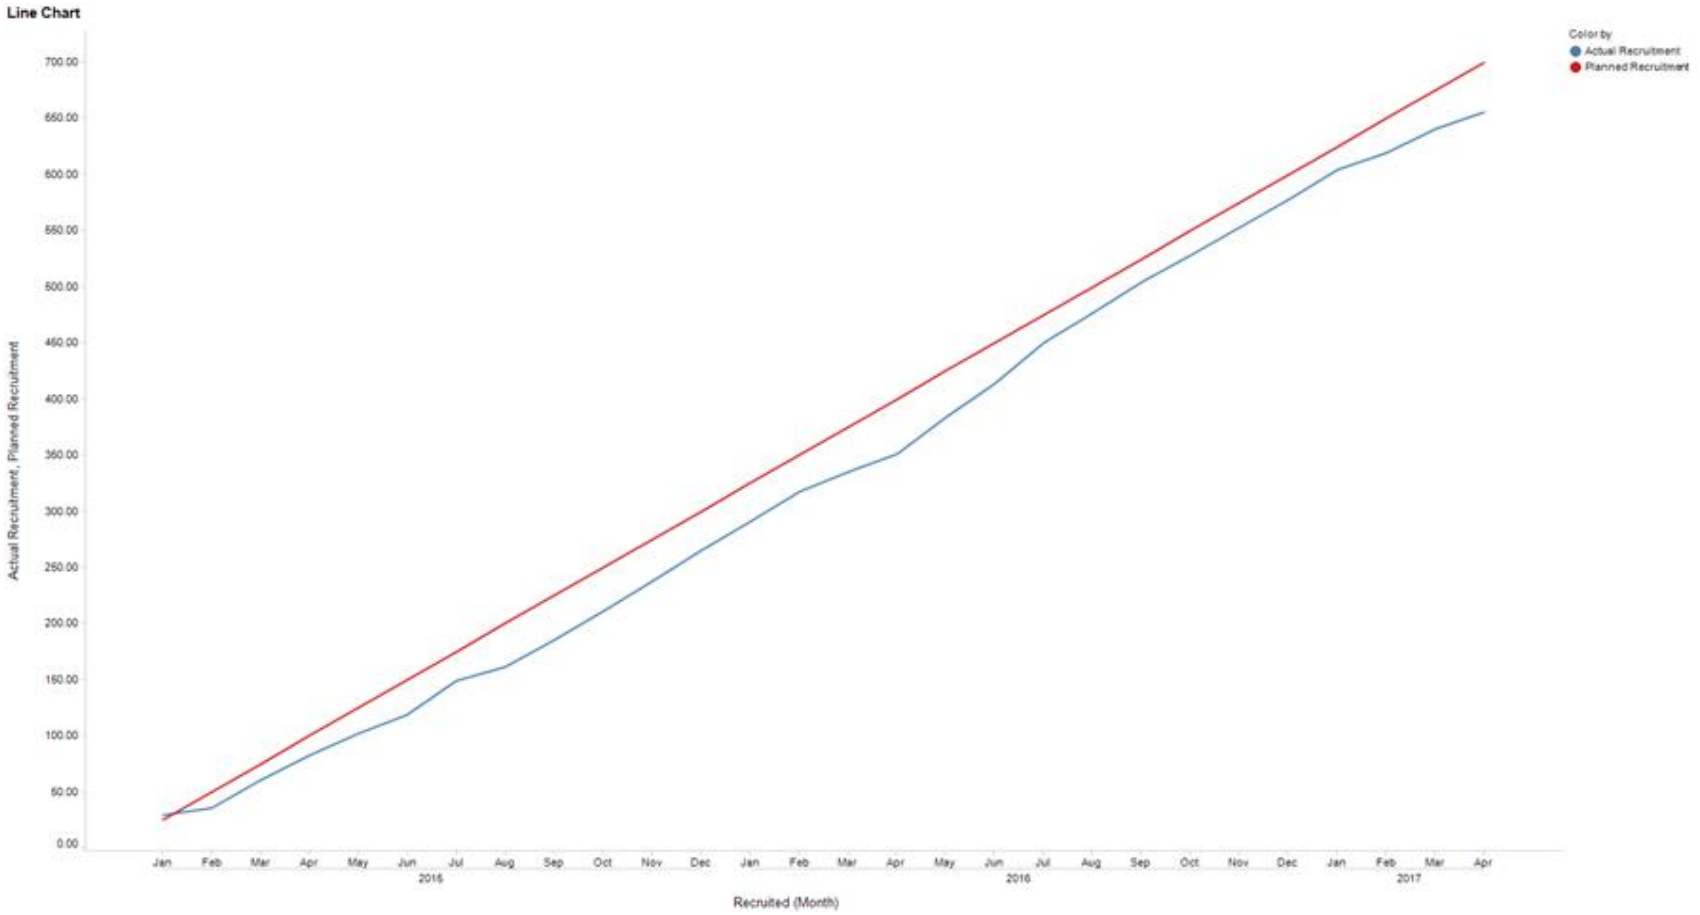
PROCLIPI: 879 patients recruited, 44 sites, from 18 countries, 4 continents



Spatz FoundationQa

Year 2: Planned PROCLIPI recruitment

Year 2: Actual PROCLIPI recruitment



Stage of Patients n=879

Early stage MF; IB

Overall Stage	**Number of Patients**	**%**
IA	323	48%
IB	314	46%
IIA	43	6%
Early Stage Disease	**680**	**77%**
IIB	70	35%
IIIA	27	14%
IIIB	29	15%
IVA(1)	41	21%
IVA(2)	25	13%
IVB	7	4%
Advanced Stage Disease	**199**	**23%**

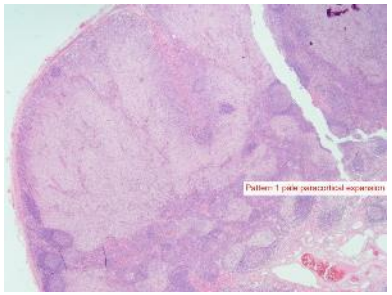
Late stage ‘tumour’ MF; IIB

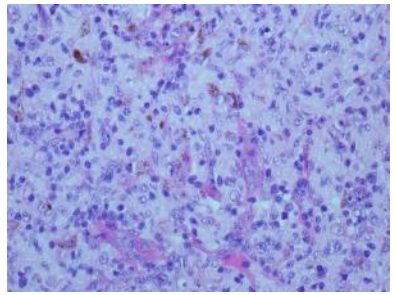
Early stage data: 680 patients

Stage IA; <10% patches & plaques
n=323 patients

Stage IB; >10% patches & plaques
n=314 patients

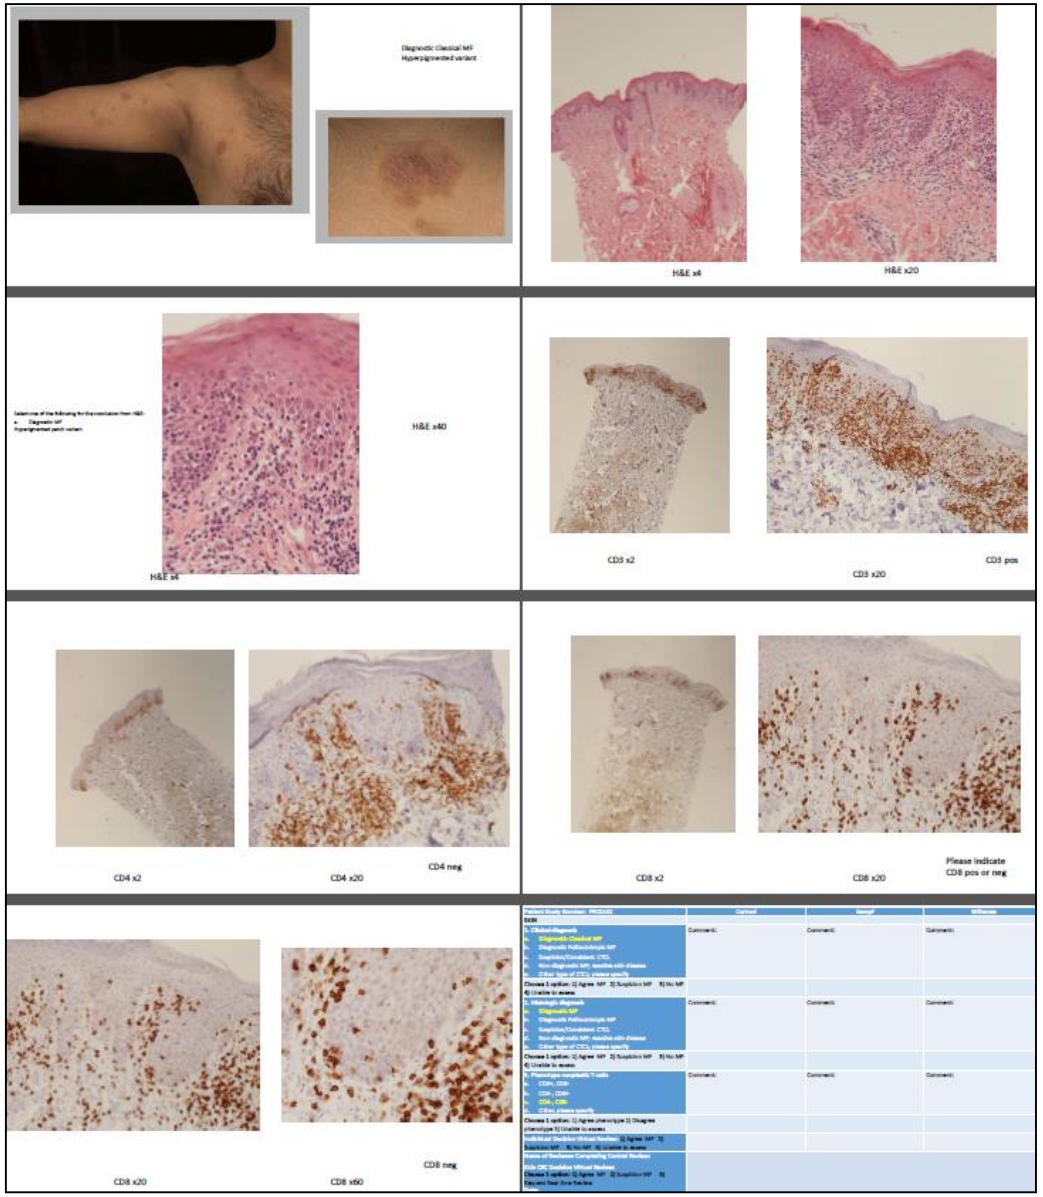
Stage IIA; Patches & plaques with enlarged lymph nodes showing dermatopathic changes or early involvement with MF (not effaced)
n=43 patients





Central Review of Early Stage: Clinical, histopathological & immunohistochemical

Virtual Central Review PDF



Central Review Team

Only patients passing central review will be included in the prognostic modelling - Early Stage review is Clinical, histopathological & immunohistochemical

Central Review Results:

378 undergone virtual central review

289 passed virtual review (76.4%) passed

89 (23.6%) failed

- 54 cases considered suspicious but non-diagnostic (opportunity for real-time review)
- 12 cases considered advanced MF
- 23 cases non diagnostic MF

Of 54 selected for Real-Time Central Review

- 39 undergone real-time central review (NY 28.10.16, Zurich 24.11.17)
  - 18 passed
  - 21 failed (2advanced / 19 non-diagnostic)
- 15 awaiting central review (3?advanced / 12 ?non-diagnostic)

Overall central review pass rate was 307/363 = 84.6%

- 275 patients (83%) classical MF
- 57 patients (17%) folliculotropic MF
- 6 patients (2%) had large cell transformation

Overall pass rate = 84.6%

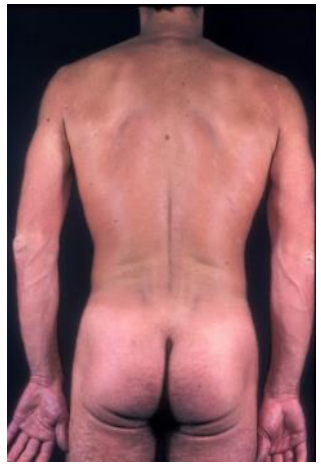
Late stage data: 199 patients

Stage IIB; tumour stage n=59 patients

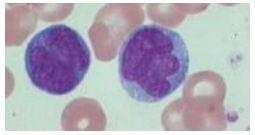
Erythroderma IIIA-IVA1

n= 68 patients

Stage IIIA; low blood tumour burden (B0) n=27 patients

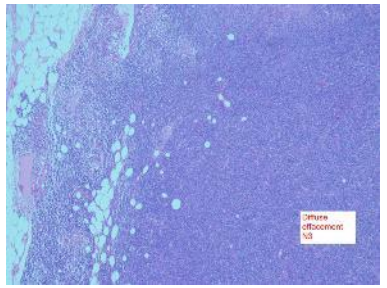


Stage IIIB; Moderate blood tumour burden (B1) n=29 patients

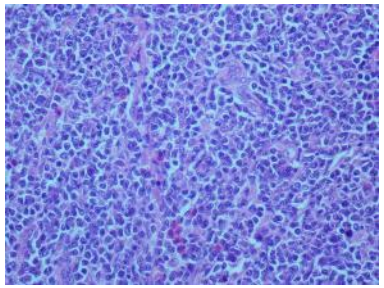


Stage IVA1; high tumour burden (B2) n=41 patients

Stage IVA2; Lymph nodes showing effaced lymph nodes n=25 patients



Stage IVB; Visceral disease n=7 patients



Central Review of Late Stage: histopathological & immunohistochemical

Central Review Team Late stage;

Clinical Data on 879 patients*

*Includes patient data not yet receiving central review

	IA	IB	IIA	IIB	IIIA	IIIB	IVA(1)	IVA(2)	IVB	All Patients
Number of Patients	323	314	43	70	27	29	41	25	7	879
Classical Mycosis Fungoides	273 (84.5%)	252 (80.3%)	31 (72.1%)	48 (68.6%)	14 (51.9%)	5 (17.2%)	3 (7.3%)	9 (36.0%)	3 (42.9%)	638 (72.6%)
Folliculotropic Mycosis Fungoides	43 (13.3%)	56 (17.8%)	10 (23.3%)	22 (31.4%)	3 (11.1%)	2 (6.9%)	1 (2.4%)	3 (12.0%)	1 (14.3%)	141 (16.0%)
Sezary Syndrome	(0.0%)	1 (0.3%)	2 (4.7%)	(0.0%)	10 (37.0%)	22 (75.9%)	37 (90.2%)	13 (52.0%)	3 (42.9%)	88 (10.0%)
Median age years (IQR)	55 (43, 67)	58 (47, 69)	65 (52, 74)	66 (54, 79.8)	65 (53, 70.5)	68 (57, 78)	67 (59, 71)	65 (57, 73)	48 (36, 64.5)	60 (47, 70)
Male:Female	1.9:1	1.5:1	2.6:1	1.8:1	1.7:1	1.4:1	2.2:1	1.1:1	2.5:1.0	1.7:1.0
Diagnostic Delay: Median duration MF-like lesions, months	30 (12, 72)	36 (14, 84)	28 (11, 63)	24 (12, 48)	59(23, 131)	24 (12, 36)	38 (21, 51)	41 (29, 72)	15 (5, 39)	36 (12, 72)

- Median age early stage (IA-IIA) is 57 years which is significantly younger than late stages IIB-IVB at 66 years ($p<0.0001$)
- There was no significant difference between duration of MF like lesions in IA versus IB disease ($p=0.1739$) or in early (34 months) versus late disease at 36 months ($p=0.9715$)
