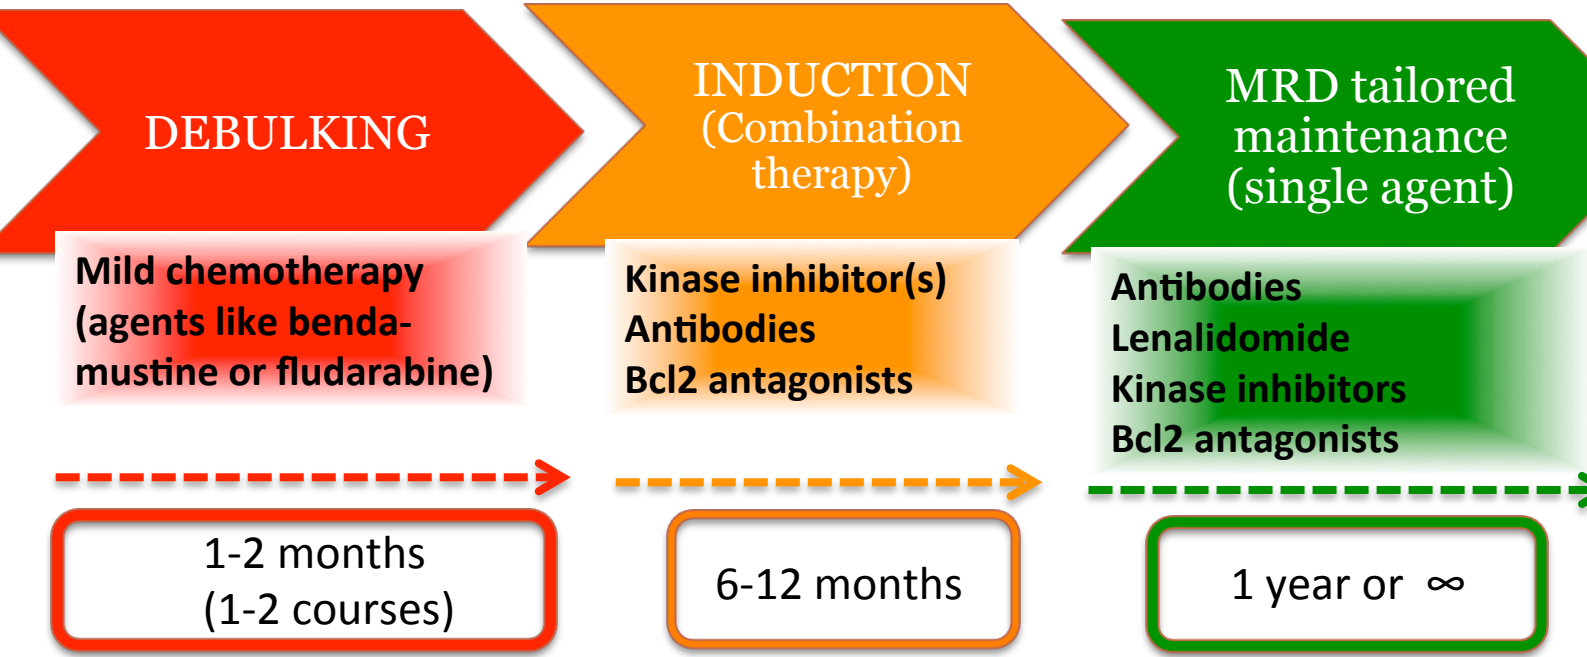
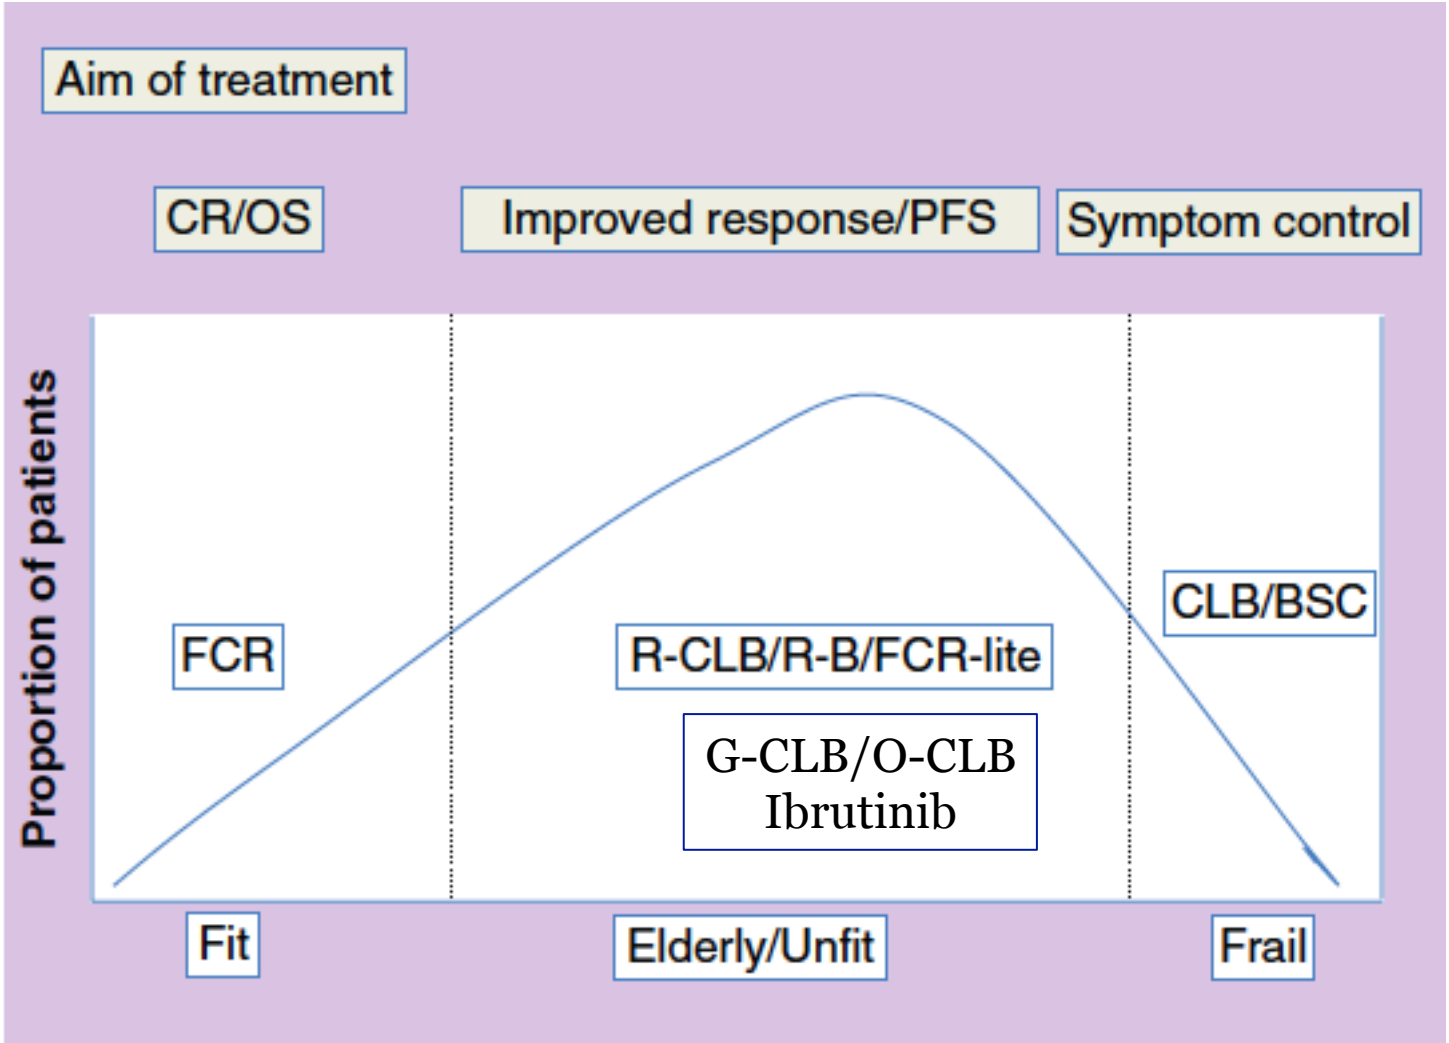
Chronic Lymphocytic Leukemia: A New Treatment Era is Born

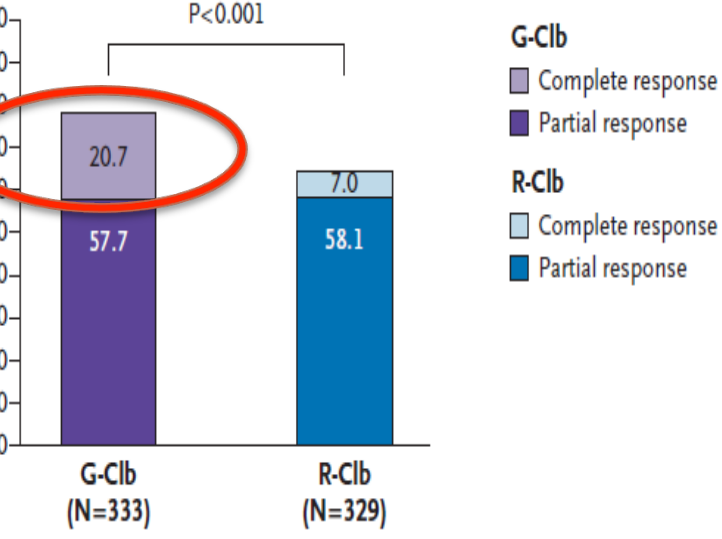
Potential future strategies to achieve long-term control of CLL
***"sequential triple T"*: tailored, targeted, total eradication of MRD**



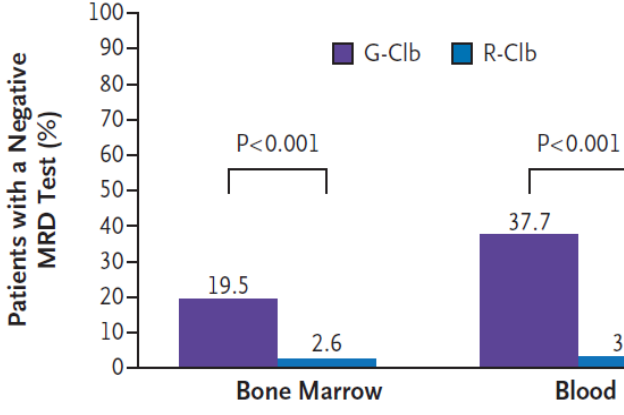
unmet clinical need



CLL11 stage II Response Rate



CLL11 stage II MRD negativi



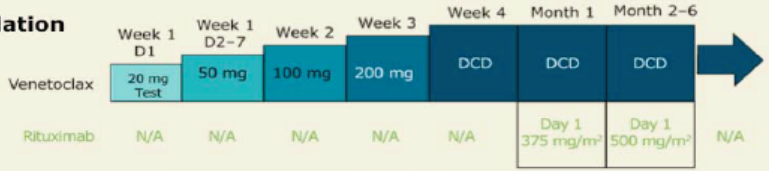
No. of Patients	26/133	3/114	87/231	

COMPLEMENT-1 (O-CLB vs CLB)

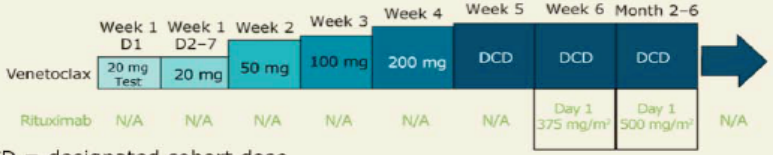
EGATIVE MRD Assessment	CHL		O+CHL	
	N	MRD^{neg} n (%)	N	MRD^{n} n (%
l Subjects (irrespective of response or sample availability)	226	8 (4)	221	26 (1
MRD^{neg} in PB or BM at 3M post treatment	226	4 (2)	221	19 (9
MRD^{neg}in BM at 3M or MRD^{neg} at 6M in PB	226	5(2)	221	17 (8
bjects with IRC-assessed CR or CRi	3	0	32	12 (3
bjects with IRC-assessed PR or nPR	152	7 (5)‡	150	14 (9

More than 50% of CR/CRi subject remained MRD negative in PB for >12 months, 4 subjects were M
egative in BM (out of 8 BM samples)

Final Escalation Strategy:



OR: if one or more electrolytes meet Cairo-Bishop criteria and/or if there is ≥30% decrease in ALC with first dose



D = day; DCD = designated cohort dose
Protocol amendment permits 20 mg for first week, as needed

- The MTD was not identified.
- Selection of 400 mg for assessment in the safety expansion dose was based on trends of higher toxicities at doses >400 mg and informed by data from other studies.

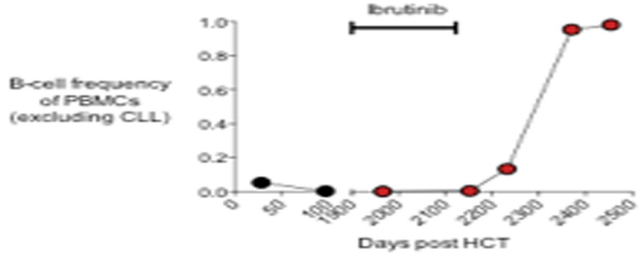
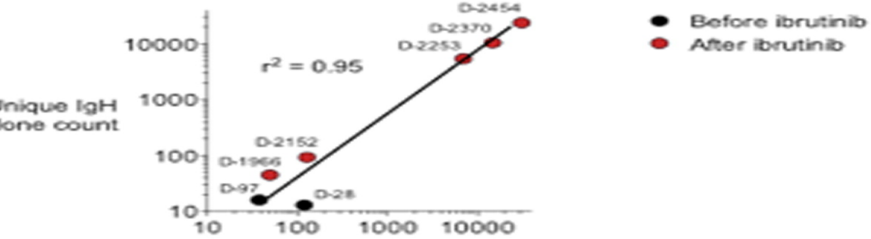
D





MRD in CLL: Clinical relevance

Minimal residual disease status has been shown to be one of the most powerful predictors not only for PFS but also for OS in patients treated with CIT.

No data on the correlation between MRD and PFS with ibrutinib or idelalisib

Until now, MRD assessment has been recommende as a tool for clinical trials but not as routine practic

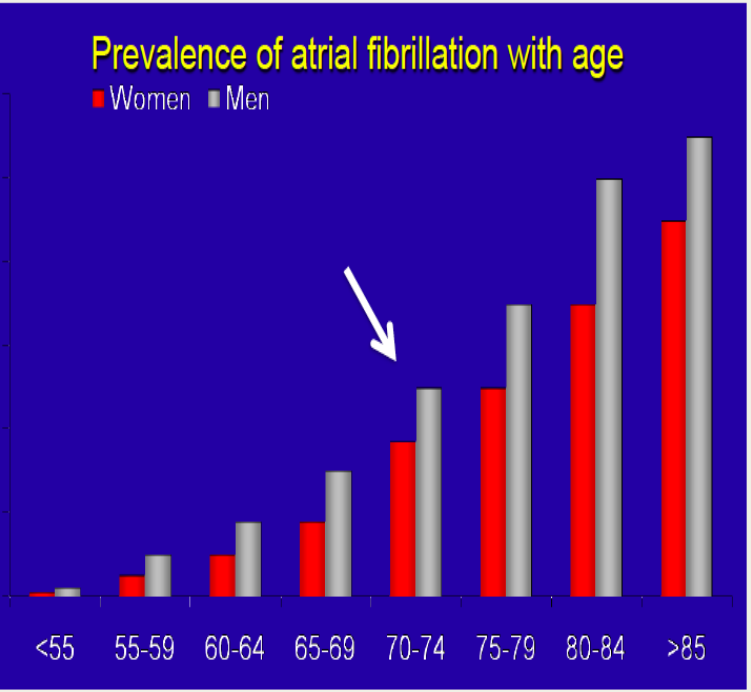
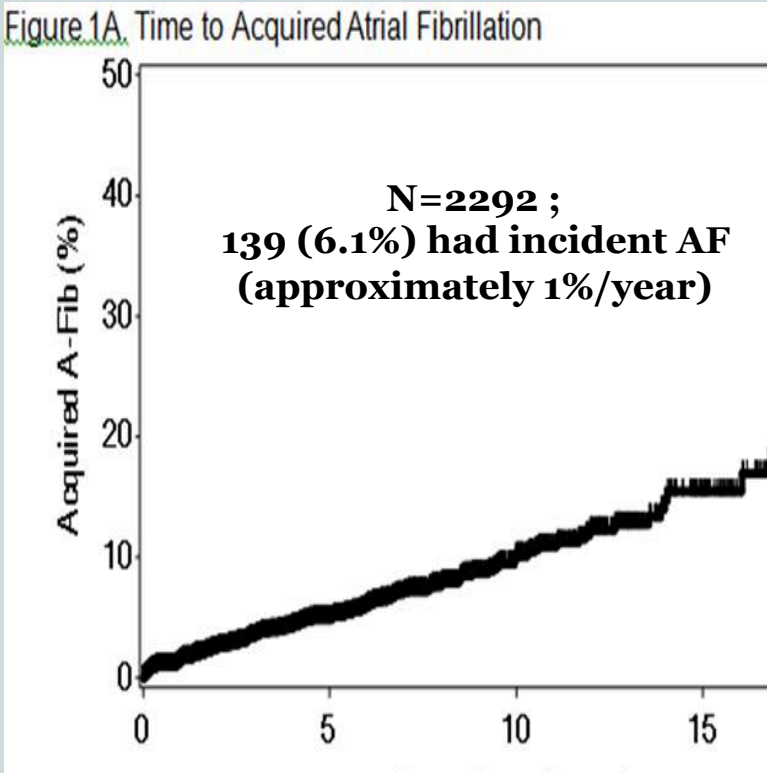
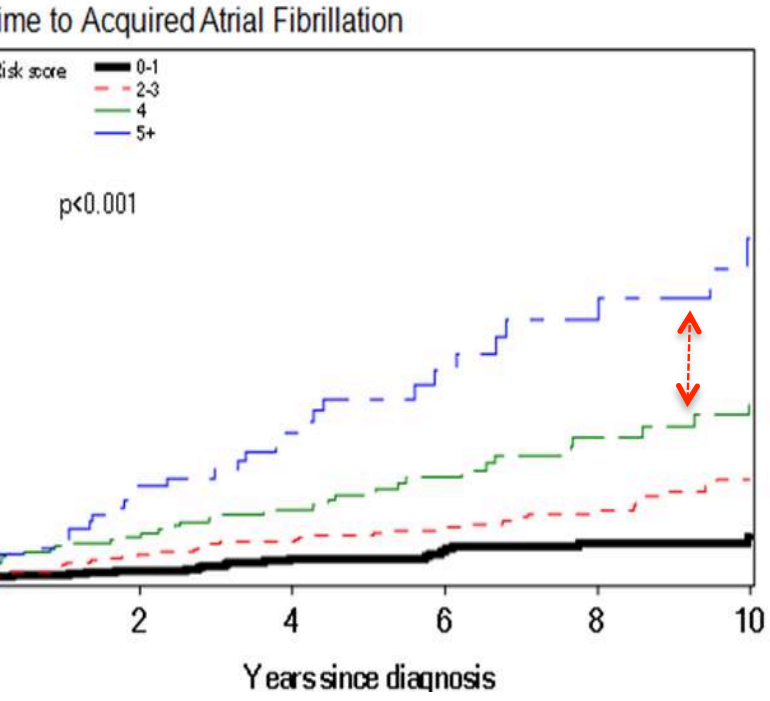
course of the natural history of CLL.





2950 - Atrial Fibrillation in Patients with Chronic Lymphocytic Leukemia (CLL)



Factors associated with an increased risk of developing AF

Factor	Hazard Ratio
Age ≥ 75 years	3.6
Gender (male)	1.8
Valvular heart disease	2.4
Hypertension	1.5

Changing Clinical Practice in CLL

The incidence of AF increases with age and over the course of the natural history of CLL.

It is reasonable to consider ibrutinib even in patients with risk factors for atrial fibrillation.

It is imperative that clinicians understand the risk and educate patients on the symptoms of this adverse event.

- 5 pts with laboratory TLS duri dose escalation
  - 2 dose interruptions (1 day ea but no clinical TLS
- Serious AEs in 55% of pts
  - Most common SAEs: pyrexia, 7%; AIHA, 7%; pneumonia, 6% febrile neutropenia, 5%

Relapsed/Refractory CLL

First-in-human study of second-generation BTK inhibitor acalabrutinib (ACP-196)

R/R CLL/SLL; ECOG PS 0-2; no prior BTK inhibitors* (N = 61†)

Acalabrutinib Dose Escalation (Phase I)
100 mg QD (n = 9†)
175 mg QD (n = 8)
250 mg QD (n = 7)
400 mg QD (n = 6)

Acalabrutinib Dose Expansion (Phase II)
100 mg BID
(n = 31)

or BCL-2 or PI3Kδ inhibitors, pancytopenia, and prior BMT allowed.
t discontinued prior to 28-day DLT review.

Tumor assessments at BL and end of cycles 2, 4, 6, 9, 12, 15, 18, 21, and 24 (day cycles)

Primary objective: safety, MTD

Secondary objectives: PK, PD, tumor response, PFS

Response

ponse, %	All Cohorts (n = 60*)	100 mg QD (n = 8)	175 mg QD (n = 8)	250 mg QD (n = 7)	400 mg QD (n = 6)	100 BI (n =
	85	100	75	100	100	77
lymphocytosis	10	0	25	0	0	1
	5	0	0	0	0	10
	0	0	0	0	0	0

dified iwCLL 2008 best overall response assessment.

At median follow-up of 14.3 mos:

- ORR (n = 60): 95%
- del(17p) ORR (n = 18): 100%

Best responses over time: PR increases, PR + lymphocytosis decreases

Reduced lymphocytosis and lymphadenopathy by CT (56/57 pts with BL assessments) over time

Acalabrutinib in R/R CLL: Safety

Median follow-up: 14.3 mos

s, % (N = 61)	Grade 1/2	Grade 3

▪Pneumonia, grades 3-5	10
▪AIHA, grade 3	3
▪Pyrexia, grade 2/3	3

*1 unrelated fatal pneumonia.

- No major bleeding events or atrial fibrillation reported
- 8 discontinuations: CLL progression (fatal pneumonia (1); investigator or p decision (2); diarrhea (1), dyspnea (1 gastritis (1), active AIHA requiring treatment (1)

16 relapsed/refractory CLL patients including 5 RS patients were enrolled.

4 out of 5 RS patients had responded to therapy.

3 RS patients who had responded to therapy had decreased or stable sPD-L1 levels

The 4th RS and two CLL had increased sPD-L1 levels an had not demonstrated clinical response.

Experiences in clinical practice seem to confirm in terms of efficacy and safety results of clinical als.

Use of an alternate BCRi following discontinuation of another BCRi is efficacious in > 50%.

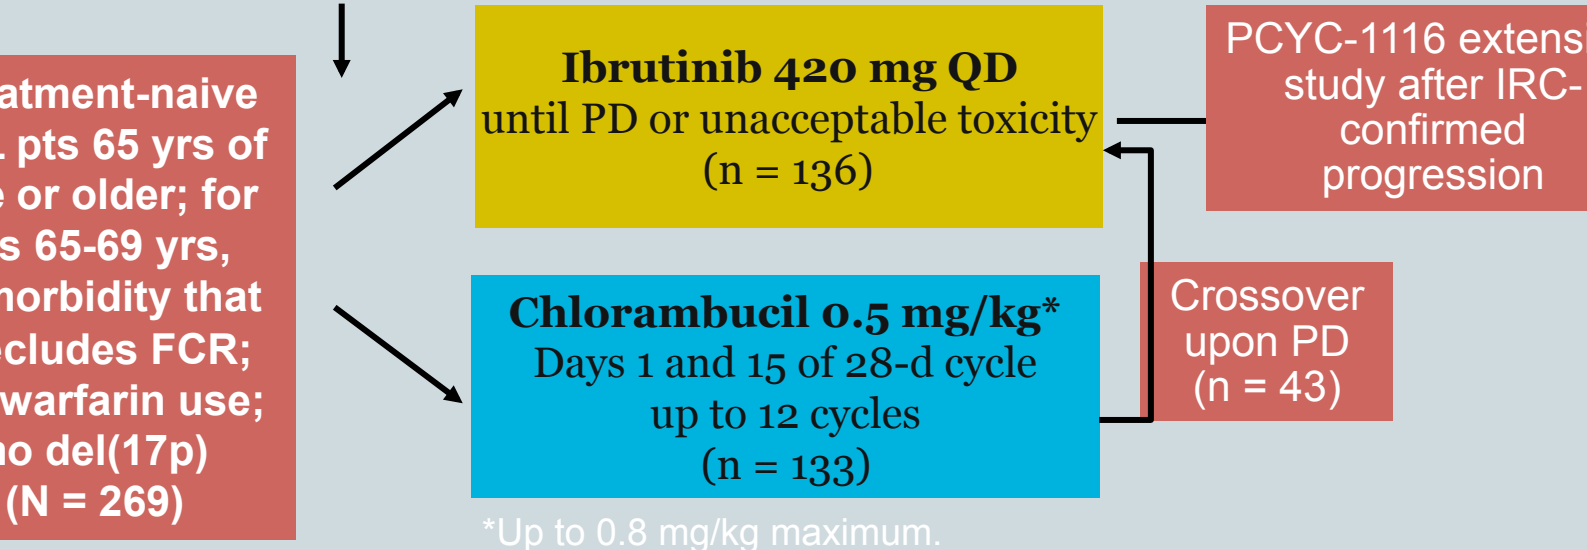
The association of BCRi with CIT should be reserve only to patients included in clinical trial.

	action		
Duvelisib	PI3K-δ, ɣ inhibitor		Duvelisib vs Ofatumuma (phase III) Duvelisib/Obinutuzuma after BTK inhibitor
Acalabrutinib (ACP-196)	BTK inhibitor	Acalabrutinib alone vs Acalabrutinib plus Obinutuzumab vs Obinutuzumab Plus Chlorambucil (phase III)	Acalabrutinib vs Ibrutin (phase III)
Pembrolizumab	PD-1 Inhibitor		Relapsed/refractory CL (phase II)
CAR T cells	Adoptive T-cell therapy		Relapsed/refractory CL (phase I /II)

Ibrutinib vs Chlorambucil in Tx-Naïve Elderly Pts With CLL (RESONATE-2)

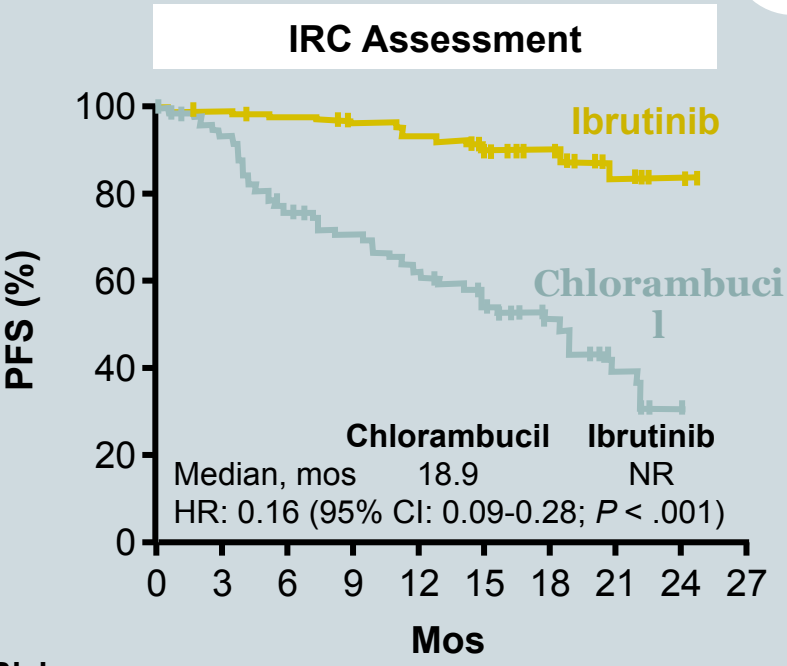
Open-label, randomized phase III trial

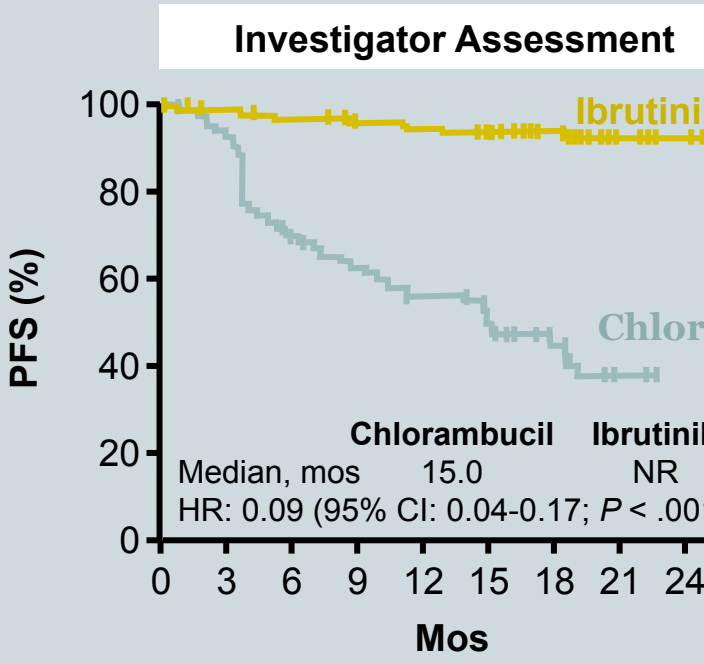
Primary endpoint: IRC-evaluated PFS
Secondary endpoints: OS, ORR, hematologic improvement, safety



*Up to 0.8 mg/kg maximum.

RESONATE 2: PFS (Primary Endpoint)





Risk, n
brutinib 136 133 130 126 122 98 66 21 2 0
mbucil 133 121 95 85 74 49 34 10 0 0

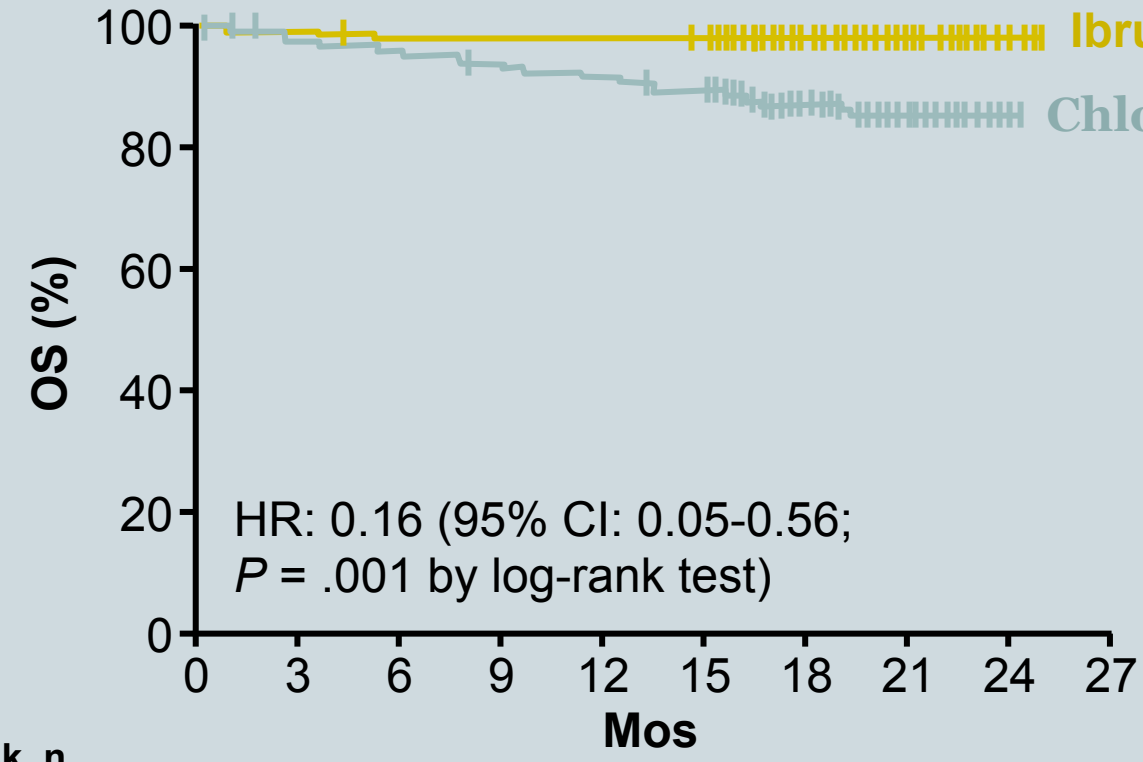
Pts at Risk, n
Ibrutinib 136 133 129 125 123 104 69 22 2
Chlorambucil 133 121 88 88 69 46 31 10 0

PFS results not dependent on age, Rai stage, ECOG PS, or bulky disease

1 Richter's transformation in chlorambucil arm; none on ibrutinib arm

RESONATE-2: OS

84% reduction in risk of death with ibrutinib



Pts at Risk, n										
Ibrutinib	136	134	131	131	131	129	74	32	4	0
Chlorambucil	133	127	125	121	118	113	62	24	1	0

RESONATE-2: Adverse Events

rameter	Ibrutinib (n = 136)	Chlorambucil (n = 133)
dian duration of study treatment, mos nge)	17.4 (0.7-24.7)	7.1 (0.5-11.7)
ected AEs, %		
Hypertension	14	0
Atrial fibrillation	6	1
Major hemorrhage	4	2

Pts with grade 3 HTN (n = 6) managed with anti-HTN drugs, did not require dose reduction of ibrutinib; 4 had history of HTN

Among pts with atrial fibrillation (n = 8), 2 discontinued ibrutinib

- 7 of 8 with history of HTN, CAD, and/or myocardial ischemia

Among pts with major bleeding (n = 6), 3 discontinued ibrutinib

- 3 of 6 on concomitant aspirin or low-molecular-weight heparin

(Study 115): Study Design

Randomized, double-blind, placebo-controlled phase III study

tratified by 17p deletion and/or TP53 mutation, IGHV mutation status, relapsed vs refractory

LL* with measurable isease, no history of LL transformation or rior BTK/PI3Kδ/SYK inhibitor use (N = 416)

Idelalisib† 150 mg BID + **Bendamustine** 70 mg/m² D1,2 Q4W, C1-6 + **Rituximab** 375 mg/m² C1, 500 mg/m² C2-6 (n = 207)

Placebo† BID + **Bendamustine** 70 mg/m² D1,2 Q4W, C1-6 + **Rituximab** 375 mg/m² C1, 500 mg/m² C2-6 (n = 209)

Followed fo with post-st therapy a investigato discretio

ogression < 36 mos from last therapy, requiring treatment, but no progression within 6 mos of las damustine.

utinib and placebo until progression or intolerance

CLL Summary

- Ibrutinib is highly active in previously untreated elderly pts with CLL/SLL
- The combination of idelalisib with bendamustine/rituximab is active in R/R CLL
  - Associated with increased toxicity compared with BR
- Switching to ibrutinib or idelalisib after failure of the alternative kinase inhibitor appears active and may be a reasonable approach

CLL Summary

- Venetoclax is active with deep responses in R/R CLL with del(17p)
  - Tumor lysis syndrome may occur and pts should be carefull monitored
- Acalabrutinib, a second-generation BTK inhibitor, i highly active in R/R CLL
  - Phase III study comparing ibrutinib vs acalabrutinib for previously treated CLL under way
